#### Abstract

We introduce the first process algebra with non-blocking reading actions for modelling concurrent asynchronous systems, and we do it in two different ways: one is more flexible, the other is simpler since it needs only one type of transitions. We study the impact this new kind of actions have on fairness, liveness and the timing of systems, using Dekker's mutual exclusion algorithm we already considered in [4] as running example. Regarding some actions as reading, this algorithm satisfies MUTEX liveness already under the assumption of fairness of actions. We demonstrate an interesting correspondence between liveness and the catastrophic cycles that we introduced in $[7]$ when studying the performance of pipelining. Finally, our previous result on the correspondence between timing and fairness [4] scales up to the extended language.

## 1 Introduction

Read arcs are an extension of classical Petri nets to model non-destructive reading operations; they allow multiple concurrent reading of the same resource, a quite frequent situation in many distributed systems. Read-arcs represent positive context conditions, i.e. elements which are needed for an event to occur, but are not affected by it. As argued in [15], the importance of such elements is twofold. Firstly, they allow a faithful representation of systems where the notion of "reading without consuming" is commonly used, like database systems, concurrent constraint programming, or any computation framework based on shared memory. Secondly, they allow to specify directly and naturally a level of concurrency greater than in classical nets: two transitions reading the same place may occur in any order and also simultaneously; in classical nets, the transitions would be connected to the place by loops such that they cannot occur simultaneously. Read arcs have been used to model a variety of applications such as transaction serialisability in databases [18], concurrent constraint programming [16], asynchronous systems [19], and cryptographic protocols [11].

Semantics and expressivity of read arcs have been studied e.g. in the following: [2] discusses a step semantics. [1] discusses the expressiveness of timed Petri nets and timed automata and shows that timed Petri nets with read-arcs unify timed Petri nets and timed automata. Finally, [19] shows that read arcs add relevant expressivity; the MUTEX problem can be solved with nets having read arcs but not with ordinary nets having no read arcs.

In this paper, we introduce the first process algebra with non-blocking reading; we add reading in the form of a read-action prefix to PAFAS [3], a process algebra for modelling timed concurrent asynchronous systems. We present two different ways to enhance our process algebra with such non-blocking actions: one is more flexible, the other is simpler since it needs only one type of transition relation; we provide a translation of the latter into the former in Section 4. Nonblocking actions have a direct impact on the timed behaviour of systems. To show this with a
simple example, consider a system composed of two processes that need to read the same variable to prepare an output they produce together. Such a system can be described in PAFAS as (r.o.nil $\|_{\{o\}}$ r.o.nil) $\|_{\{r, w\}}$ rec $x .(r . x+w . x)$, where r.o.nil $\|_{\{o\}} r$ r.o.nil models the two processes that read from the same variable and produce the output $o$ together, while rec $x .(r \cdot x+w \cdot x)$ models the variable that can repeatedly be read with $r$ or written with $w$. According to the PAFAS semantics, enabled actions are performed immediately or become urgent after one time unit and must occur then; thus, after at most one time unit, the first $r$ occurs. With the given model of the variable, every time an action $r$ is performed, a new instance of $r$ is generated that can let one time unit pass; thus, a second time unit might pass before the second $r$, and the output is produced within three time units in the worst-case. If the read action $r$ were modelled as a non-blocking action, written rec $x . r \triangleright w . x$, then the worst-case efficiency for producing the output would be two time units. In this case, after one time unit and the occurrence of the first $r$, the variable offers the same non-blocking action $r$ such that the second $r$ is still urgent and has to be performed before the second time step.

In previous work, we have shown that our notion of time [8] is strongly related to (weak) fairness, which requires that an action has to be performed, a component has to act resp., whenever it is enabled continuously in a run. We have proven that each everlasting (or non-Zeno) timed process execution is fair and vice versa, where fairness is defined in an intuitive but complicated way in the spirit of $[10,9]$. In fact, we have shown this correspondence for fairness of actions [4] and with a modified notion of timing for fairness of components [5]. We used these characterisations in [6] to study the liveness property for Dekker's mutual exclusion algorithm, and proved that Dekker is live under the assumption of fairness of components but not under the assumption of fairness of actions.

Here, we show that non-blocking actions preserve the above correspondence result between fairness of actions and timing. Another main result is that, in the new setting, Dekker's algorithm is live when assuming fairness of actions, provided we regard as non-blocking the reading of a variable (as $r$ in rec $x .(r . x+w . x)$ above) as well as its writing in the case that the written value equals the current value. This kind of re-write does not change the state of the variable and, hence, can be thought of as a non-destructive or non-consuming operation (allowing potential concurrent behaviour). This way of accessing a variable is not new; in Remark 1.1 below, we describe how it is implemented in the area of databases.

Finally, we develop an interesting connection between liveness of MUTEX algorithms and catastrophic cycles: we considered the latter in [7] studying the very different problem of asymptotic performance for the specific, but often occurring class of request-response processes (having only actions in and out). A cycle in a transition system is catastrophic if it only contains time steps and internal actions, and we showed that a process can refuse to serve some request within finite time if and only if a reduced transition system of the process contains a catastrophic cycle. We also pointed out that the existence of catastrophic cycles in a reduced transition system can be determined in polynomial time. In the present paper, we show how to modify the process Dekker such that Dekker satisfies liveness under the assumption of fairness of actions if and only if the modified process does not have a catastrophic cycle. This opens the way to check automatically the liveness property for MUTEX algorithms.

Remark 1.1 Our idea of re-write has been implemented with the so-called two-phase locking protocol, that is used for preventing transaction conflicts (i.e. two transactions working on the same data item with at least one of them writing). Such a protocol implements a lock system where each transaction may only access a data item if it holds a lock on that item. There are two possible modes of locks: shared and exclusive. If a transaction $T$ holds a shared mode lock (an S-lock, for short) on data item $q$, then $T$ may read - but not write $-q$. On the other hand, a transaction with an exclusive mode lock (an X-lock) on $q$ can both read and write it. Multiple S-locks are allowed on
a single data item, but only one X-lock can be acquired for it. This allows multiple reads (which do not create serialisability conflicts) as in our modelling of variables, but writing prevents reading or another writing interaction (which would create conflicts).

In the two-phase locking protocol, a transaction can acquire new locks only during the so-called growing phase. All the locks acquired in the growing phase can be released only during a subsequent phase, called shrinking phase. Furthermore, an S-lock can be upgraded to X during the growing phase and, similarly, an X-lock can be downgraded to S during the shrinking phase. The idea here is that - during the growing phase - a transaction, instead of holding an X-lock on an item that it does not need to write yet, can hold an S-lock until the point where modifications to the old value begin, in order to allow other transactions to read the old value for longer. This can be used for a "reading first" implementation of writing: each write operation first reads the old value (this read requires an S-lock for the variable and can be done concurrently with other read operations) and then only writes a new one if it is really different (in this latter case, the S-lock has to be upgraded to an X-lock). This way, a re-writing of the same value is indeed non-blocking.

The rest of the paper is organised as follows. The next section introduces PAFAS with readprefixes, and its functional and temporal operational semantics. Section 3 presents an alternative way of introducing non-blocking actions in process algebras. Section 4 contrasts our two alternative approaches of introducing non-blocking actions in process algebras. Section 5 introduces fairness, while Section 6 relates it to timing. Finally, Section 8 investigates the liveness of Dekker's algorithm under the assumption of fairness of actions and presents the interesting connection between liveness and catastrophic cycles.

## 2 A process algebra for describing read behaviours

In this section we introduce a new process description language - called $\mathrm{PAFAS}_{r}$ - suitable to model non-blocking reading in concurrent asynchronous systems, a feature with an impact on fair and on timed behaviour as already discussed in [19] in a Petri net setting. PAFAS $_{r}$ is an extension of the timed process algebra PAFAS, introduced in [8] for evaluating the worst-case efficiency of asynchronous systems and used in $[4,5]$ for studying fairness of actions and components in system computations.

PAFAS is a CCS-like process description language [14] (with a TCSP-like parallel composition), where basic actions are atomic and instantaneous but have associated an upper time bound (either 0 or 1 , for simplicity) interpreted as a maximal time delay for their execution. As explained in [8], these upper time bounds can be used for evaluating the performance of asynchronous systems, but do not influence functionality (which actions are performed); so compared to CCS, also PAFAS treats the full functionality of asynchronous systems. With respect to the original language in [8], here we introduce the new operator $\triangleright$ to represent non-blocking behaviour of processes. Intuitively, the term $\alpha \triangleright P$ models a process like a variable or a more complex data structure that behaves as $P$ but can additionally be read with $\alpha$ : since being read does not change the state, $\alpha$ can be performed repeatedly until the execution of some ordinary action of $P$, and it does not block a synchronisation partner as described below.

We use the following notation. $\mathbb{A}$ is an infinite set of basic actions. An additional action $\tau$ is used to represent internal activity, which is unobservable for other components. We define $\mathbb{A}_{\tau}=\mathbb{A} \cup\{\tau\}$. Elements of $\mathbb{A}$ are denoted by $a, b, c, \ldots$ and those of $\mathbb{A}_{\tau}$ are denoted by $\alpha, \beta, \ldots$ Actions in $\mathbb{A}_{\tau}$ can let time 1 pass before their execution, i.e. 1 is their maximal delay. After that time, they become urgent actions written $\underline{a}$ or $\underline{\tau}$; these have maximal delay 0 . The set of urgent actions is denoted by $\mathbb{A}_{\tau}=\{\underline{a} \mid a \in \mathbb{A}\} \cup\{\underline{\tau}\}$ and is ranged over by $\underline{\alpha}, \underline{\beta}, \ldots$. Elements of $\mathbb{A}_{\tau} \cup \mathbb{A}_{\tau}$ are ranged over by $\mu$.
$\mathcal{X}$ is the set of process variables, used for recursive definitions. Elements of $\mathcal{X}$ are denoted by $x, y, z, \ldots \Phi: \mathbb{A}_{\tau} \rightarrow \mathbb{A}_{\tau}$ is a general relabelling function if the set $\left\{\alpha \in \mathbb{A}_{\tau} \mid \emptyset \neq \Phi^{-1}(\alpha) \neq\{\alpha\}\right\}$ is
finite and $\Phi(\tau)=\tau$. Such a function can also be used to define hiding: $P / A$, where the actions in $A$ are made internal, is the same as $P\left[\Phi_{A}\right]$, where the relabeling function $\Phi_{A}$ is defined by $\Phi_{A}(\alpha)=\tau$ if $\alpha \in A$ and $\Phi_{A}(\alpha)=\alpha$ if $\alpha \notin A$. We assume that time elapses in a discrete way ${ }^{1}$. Thus, an action prefixed process $a . P$ can either do action $a$ and become process $P$ (as usual in CCS) or can let one time step pass and become $\underline{a} . P ; \underline{a}$ is called urgent $a$, and $\underline{a} . P$ as a stand-alone process cannot let time pass, but can only do $a$ to become $P$.

In the following definition, initial processes are just processes of a standard process algebra extended with $\triangleright$. General processes are defined here such that they include all processes reachable from the initial ones according to the operational semantics to be defined below.

Definition 2.1 (timed process terms) The set $\tilde{\mathbb{P}}_{1}$ of initial (timed) process terms is generated by the following grammar

$$
P::=\text { nil }|x| \alpha . P|\alpha \triangleright P| P+P\left|P \|_{A} P\right| P[\Phi] \mid \text { rec } x . P
$$

where nil is a constant, $x \in \mathcal{X}, \alpha \in \mathbb{A}_{\tau}, \Phi$ is a general relabelling function and $A \subseteq \mathbb{A}$ possibly infinite. We assume that recursion is action-guarded (see below). The set $\tilde{\mathbb{P}}$ of (general) (timed) process terms is generated by the following grammar:

$$
Q::=P|\underline{\alpha} \cdot P| \mu \triangleright Q|Q+Q| Q \|_{A} Q|Q[\Phi]| \operatorname{rec} x \cdot Q
$$

where $P \in \tilde{\mathbb{P}}_{1}, x \in \mathcal{X}, \alpha \in \mathbb{A}_{\tau}, \mu \in \mathbb{A}_{\tau} \cup \mathbb{A}_{\tau} ;$ again $\Phi$ is a general relabelling function and $A \subseteq \mathbb{A}$ possibly infinite. We assume that recursion is action-guarded, i.e. for rec $x . Q$ variable $x$ only appears in $Q$ within the scope of a prefix $\mu$.() with $\mu \in \mathbb{A}_{\tau} \cup \mathbb{A}_{\tau}$. A term $Q$ is action-guarded if each occurrence of a variable is guarded in this sense. A process term is closed if every variable $x$ is bound by the corresponding rec $x$-operator; the set of closed timed process terms in $\tilde{\mathbb{P}}$ and $\tilde{\mathbb{P}}_{1}$, simply called processes and initial processes resp., is denoted by $\mathbb{P}$ and $\mathbb{P}_{1}$ resp.

A brief description of the $\left(\mathrm{PAFAS}_{r}\right)$ operators now follows. The nil-process cannot perform any action, but may let time pass without limit. A trailing nil will often be omitted, so e.g. $a . b+c$ abbreviates $a . b$.nil $+c$.nil. $\mu . Q$ is (action-)prefixing known from CCS. Terms like $\alpha \triangleright Q$ and $\underline{\alpha} \triangleright Q$ model processes that behave like $Q$ except for the (lazy and urgent, respectively) non-blocking action $\alpha$. In both cases the action $\alpha$ is always enabled until component $Q$ evolves via some ordinary action, and if urgent, $\underline{\alpha}$ stays urgent even if it is performed. $Q_{1}+Q_{2}$ models the choice between two conflicting processes $Q_{1}$ and $Q_{2}$. $Q_{1} \|_{A} Q_{2}$ is the parallel composition of two processes $Q_{1}$ and $Q_{2}$ that run in parallel and have to synchronise on all actions from $A$; this synchronisation discipline is inspired from TCSP. $Q[\Phi]$ behaves as $Q$ but with the actions changed according to $\Phi$. rec $x . Q$ models a recursive definition; we also use equations to define recursive processes.

For our operational semantics we need some preliminary definitions. Given a process term $Q$, $\mathcal{U}(Q, A)$ denotes the set of the urgent actions of $Q$ when the environment prevents the actions in $A$. For technical convenience, we allow $A$ to be a subset of $\mathbb{A}_{\tau}$.

Definition 2.2 (urgent basic actions) Let $Q \in \tilde{\mathbb{P}}$ and $A \subseteq \mathbb{A}_{\tau}$. The set $\mathcal{U}(Q, A)$ is defined by induction on $Q$. The urgent actions of $Q$ are defined as $\mathcal{U}(Q, \emptyset)$ which we abbreviate to $\mathcal{U}(Q)$.

Nil, Var: $\mathcal{U}($ nil,$A)=\mathcal{U}(x, A)=\emptyset$
Pref: $\quad \mathcal{U}(\mu . P, A)=\left\{\begin{array}{cc}\{\alpha\} & \text { if } \mu=\underline{\alpha} \text { and } \alpha \notin A \\ \emptyset & \text { otherwise }\end{array}\right.$

[^0]Read: $\quad \mathcal{U}(\mu \triangleright Q, A)=\left\{\begin{array}{cc}\{\alpha\} \cup \mathcal{U}(Q, A) & \text { if } \mu=\underline{\alpha} \text { and } \alpha \notin A \\ \mathcal{U}(Q, A) & \text { otherwise }\end{array}\right.$
Sum: $\quad \mathcal{U}\left(Q_{1}+Q_{2}, A\right)=\mathcal{U}\left(Q_{1}, A\right) \cup \mathcal{U}\left(Q_{2}, A\right)$
Par: $\quad \mathcal{U}\left(Q_{1} \|_{B} Q_{2}, A\right)=\bigcup_{i=1,2} \mathcal{U}\left(Q_{i}, A \cup B\right) \cup\left(\mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B\right)$
Rel: $\quad \mathcal{U}(Q[\Phi], A)=\Phi\left(\mathcal{U}\left(Q, \Phi^{-1}(A)\right)\right)$
Rec: $\quad \mathcal{U}($ rec $x . Q, A)=\mathcal{U}(Q, A)$
The set $A$ represents the actions restricted upon. Thus, $\mathcal{U}(\mu . P, A)=\{\alpha\}$ only if $\mu=\underline{\alpha}$ and $\alpha \notin A$; otherwise $\mathcal{U}(\mu . P, A)=\emptyset$; observe that an initial process $P$ cannot have any urgent actions. The urgent actions of a nondeterministic process are the urgent actions of its alternative components. The essential idea for parallel composition is that a synchronised action can be delayed if at least one component can delay it: $\mathcal{U}\left(Q_{1} \|_{B} Q_{2}, A\right)$ includes the actions that are urgent in $Q_{1}$ or $Q_{2}$ when the actions in $A$ and in $B$ (the synchronising ones) are prevented, and the actions in $B$, but not in $A$, that are urgent both in $Q_{1}$ and in $Q_{2}$. The other rules are as expected. Observe that $\mathcal{U}(Q, A)=\mathcal{U}(Q) \backslash A$.

The operational semantics exploits two functions on process terms: clean(_) and unmark(_). Function clean(_) removes all inactive urgencies in a process term $Q \in \tilde{\mathbb{P}}$; when a process evolves and a synchronised action is no longer urgent or enabled in some synchronisation partner, then it should also lose its urgency in the others; the corresponding change of markings is performed by clean, where again set $A$ in clean $(Q, A)$ denotes the set of actions that are not enabled or urgent due to restrictions of the environment. Function unmark(_) simply removes all urgencies (inactive or not) in a process term $Q \in \tilde{\mathbb{P}}$.

Definition 2.3 (cleaning inactive urgencies) For any $Q \in \tilde{\mathbb{P}}$ we define clean $(Q)$ as clean $(Q, \emptyset)$ where, for $A \subseteq \mathbb{A}$, clean $(Q, A)$ is defined below.

Nil, Var: $\quad$ clean $($ nil,$A)=$ nil, $\quad$ clean $(x, A)=x$
Pref: $\quad$ clean $(\mu . P, A)=\left\{\begin{array}{cc}\alpha . P & \text { if } \mu=\underline{\alpha} \text { and } \alpha \in A \\ \mu . P & \text { otherwise }\end{array}\right.$
Read: $\quad$ clean $(\mu \triangleright Q, A)=\left\{\begin{array}{cc}\alpha \triangleright \operatorname{clean}(Q, A) & \text { if } \mu=\underline{\alpha} \text { and } \alpha \in A \\ \mu \triangleright \operatorname{clean}(Q, A) & \text { otherwise }\end{array}\right.$
Sum: $\quad \operatorname{clean}\left(Q_{1}+Q_{2}, A\right)=\operatorname{clean}\left(Q_{1}, A\right)+\operatorname{clean}\left(Q_{2}, A\right)$
Par: $\quad \operatorname{clean}\left(Q_{1} \|_{B} Q_{2}, A\right)=\operatorname{clean}\left(Q_{1},\left(B \backslash \mathcal{U}\left(Q_{2}\right)\right) \cup A\right) \|_{B}$ clean $\left(Q_{2},\left(B \backslash \mathcal{U}\left(Q_{1}\right)\right) \cup A\right)$
Rel: $\quad \operatorname{clean}(Q[\Phi], A)=\operatorname{clean}\left(Q, \Phi^{-1}(A)\right)[\Phi]$
Rec: $\quad \operatorname{clean}(\operatorname{rec} x . Q, A)=\operatorname{rec} x . \operatorname{clean}(Q, A)$
We say that a given $Q \in \tilde{\mathbb{P}}$ is clean if $Q=$ clean $(Q)$. Since, obviously, for any $P \in \tilde{\mathbb{P}}_{1}$ it is $P=$ clean $(P)$, we have that all initial terms are clean.

Definition 2.4 (cleaning all urgencies)
Let $Q$ be a $\tilde{\mathbb{P}}$ term. Then unmark $(Q)$ is defined by induction on $Q$ as follows:
Nil, Var: $\quad \operatorname{unmark}($ nil $)=$ nil, $\quad$ unmark $(x)=x$
Pref: $\quad$ unmark $(\alpha . P)=\operatorname{unmark}(\underline{\alpha} . P)=\alpha . P$
Read: $\quad \operatorname{unmark}(\alpha \triangleright Q)=\operatorname{unmark}(\underline{\alpha} \triangleright Q)=\alpha \triangleright \operatorname{unmark}(Q)$
Sum: $\quad \operatorname{unmark}\left(Q_{1}+Q_{2}\right)=\operatorname{unmark}\left(Q_{1}\right)+\operatorname{unmark}\left(Q_{2}\right)$
Par: $\quad \operatorname{unmark}\left(Q_{1} \|_{A} Q_{2}\right)=\operatorname{unmark}\left(Q_{1}\right) \|_{A} \operatorname{unmark}\left(Q_{2}\right)$
Rel: $\quad \operatorname{unmark}(Q[\Phi])=\operatorname{unmark}(Q)[\Phi]$
Rec: $\quad \operatorname{unmark}(\operatorname{rec} x . Q)=\operatorname{rec} x . \operatorname{unmark}(Q)$

### 2.1 The functional behaviour of PAFAS ${ }_{r}$ processes

The transitional semantics describing the functional behaviour of $\mathrm{PAFAS}_{r}$ processes indicates which basic actions they can perform. We distinguish two different transition relations $\stackrel{\alpha}{\mapsto}$ and $\stackrel{\alpha}{\rightsquigarrow}$ to describe, resp., the ordinary and the reading behaviour of $\mathrm{PAFAS}_{r}$ processes. The functional behaviour is defined as the union of these two kinds of behaviour.

Definition 2.5 (Functional operational semantics) Let $Q \in \tilde{\mathbb{P}}$ and $\alpha \in \mathbb{A}_{\tau}$. We say that $Q \xrightarrow{\alpha} Q^{\prime}$ if $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ or $Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$, where the SOS-rules defining the transition relations $\stackrel{\alpha}{\mapsto} \subseteq(\tilde{\mathbb{P}} \times \tilde{\mathbb{P}})$ (the ordinary action transitions) and $\stackrel{\alpha}{\rightsquigarrow} \subseteq(\tilde{\mathbb{P}} \times \tilde{\mathbb{P}})$ (the read action transitions) for $\alpha \in \mathbb{A}_{\tau}$, are given in Tables 1 and 2, respectively. As usual, we write $Q \xrightarrow{\alpha} Q^{\prime}$ if $\left(Q, Q^{\prime}\right) \in \xrightarrow{\alpha}$ and $Q \xrightarrow{\alpha}$ if there exists a $Q^{\prime} \in \tilde{\mathbb{P}}$ such that $\left(Q, Q^{\prime}\right) \in \xrightarrow{\alpha}$, and similar conventions will apply later on.

$$
\begin{aligned}
& \operatorname{PREF}_{o} \frac{\mu \in\{\alpha, \underline{\alpha}\}}{\mu . Q \stackrel{\alpha}{\mapsto} Q^{\prime}} \\
&
\end{aligned}
$$

Table 1: Ordinary behaviour of $\mathrm{PAFAS}_{r}$ processes
Rules in Table 1 are quite standard (apart from using clean in the Par-rules). Rule $\mathrm{PrEF}_{o}$ describes the behaviour of an action-prefixed process as usual in CCS. Notice that timing can be disregarded: when an action is performed, one cannot see whether it was urgent or not, and thus $\underline{\alpha} . P \stackrel{\alpha}{\mapsto} P$; furthermore, component $\alpha . P$ has to act within time 1, i.e. it can also act immediately, giving $\alpha . P \stackrel{\alpha}{\mapsto} P$. Rule READ $_{o}$ says that $\mu \triangleright Q$ performs the same ordinary actions as $Q$ removing the read-prefix at the same time. The use of the unmark in rule $\mathrm{REC}_{o}$ has no effects for an initial process, where $\mathrm{REC}_{o}$ is the standard SOS rule. For non-initial $Q$ we will explain this rule in Example 2.8. We use the clean function as explained before its definition. Observe that in rule
$\mathrm{PAR}_{o_{2}}$, an ordinary action transition can synchronise with both an ordinary and a read action transition. The other rules are as expected. Furthermore, symmetric rules have been omitted.

$$
\begin{aligned}
& \operatorname{READ}_{r 1} \frac{\mu \in\{\alpha, \underline{\alpha}\}}{\mu \triangleright Q \stackrel{\alpha}{\rightsquigarrow} \mu \triangleright Q} \quad \operatorname{READ}_{r 2} \frac{Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}}{\mu \triangleright Q \stackrel{\alpha}{\rightsquigarrow} \mu \triangleright Q^{\prime}} \quad \operatorname{Sum}_{r} \frac{Q_{1} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}}{Q_{1}+Q_{2} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}+Q_{2}} \\
& \operatorname{PAR}_{r 1} \frac{\alpha \notin A, Q_{1} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}}{Q_{1}\left\|_{A} Q_{2} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}\right\|_{A} Q_{2}} \\
& \operatorname{PAR}_{r 2} \frac{\alpha \in A, Q_{1} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}, Q_{2} \stackrel{\alpha}{\rightsquigarrow} Q_{2}^{\prime}}{Q_{1}\left\|_{A} Q_{2} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}\right\|_{A} Q_{2}^{\prime}} \\
& \operatorname{REL}_{r} \frac{Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}}{Q[\Phi] \stackrel{\Phi(\alpha)}{\rightsquigarrow} Q^{\prime}[\Phi]} \\
& \operatorname{REC}_{r} \frac{Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}}{\operatorname{rec} x . Q \stackrel{\alpha}{\rightsquigarrow} \operatorname{rec} x \cdot Q^{\prime}}
\end{aligned}
$$

Table 2: Reading Behaviour of $\mathrm{PAFAS}_{r}$ processes

As expected, rules in Table 2 say that the execution of reading actions does not change the state of a term $Q$ (i.e. for any $Q \in \tilde{\mathbb{P}}, Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$ implies $Q=Q^{\prime}$ - this is an easy induction proof). Again, symmetric rules are omitted.

Most important is Rule $\mathrm{READ}_{r_{2}}$. This is needed in the case of nested reading actions, and it is here that we need to distinguish read from ordinary action transitions. As an example, consider an array with two Boolean values; if the values are $t$ and $f$, the behaviour of the array can be defined as $B_{t f}=r_{0 t} \triangleright r_{1 f} \triangleright \sum_{i \in\{t, f\}}\left(w_{0 i} . B_{i f}+w_{1 i} . B_{t i}\right)$. By $r_{0 t}$, we mean the action of reading the value $t$ from entry 0 and similarly for the action $r_{1 f}$; furthermore the action $w_{j i}$ writes value $i$ into entry $j$. Now $B_{t f} \stackrel{r_{1 f}}{\sim} B_{t f}$ by Rules $\mathrm{READ}_{r 1}$ and $\mathrm{READ}_{r 2}$, allowing this non-blocking action to be repeated indefinitely. At this stage, only the execution of an ordinary action can change the current state of the array. Indeed, by Rule $\mathrm{READ}_{o}, B_{t f} \stackrel{w_{1 t}}{\mapsto} B_{t t}$.

Definition 2.6 (activated basic actions) The set of activated (or enabled) actions of $Q \in \tilde{\mathbb{P}}$ is defined as $\mathcal{A}(Q)=\{\alpha \mid Q \xrightarrow{\alpha}\}$. The set of activated actions of $Q$ when the environment prevents the actions in $A \subseteq \mathbb{A}_{\tau}$ is defined as $\mathcal{A}(Q, A)=\mathcal{A}(Q) \backslash A$.

### 2.2 The temporal behaviour of $\mathrm{PAFAS}_{r}$ processes

We are now ready to define the refusal traces of a term $Q \in \tilde{\mathbb{P}}$. Intuitively a refusal trace records, along a computation, which actions process $Q$ can perform $\left(Q \xrightarrow{\alpha} Q^{\prime}, \alpha \in \mathbb{A}_{\tau}\right)$ and which actions $Q$ can refuse to perform when time elapses $\left(Q \xrightarrow{X}_{r} Q^{\prime}, X \subseteq \mathbb{A}\right)$.

A transition like $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ is called a (partial) time-step. The actions listed in $X$ are not urgent; hence $Q$ is justified in not performing them, but performing a time step instead. This time step is partial because it can occur only in contexts that can refuse the actions not in $X$. If $X=\mathbb{A}$ then $Q$ is fully justified in performing this time-step; i.e., $Q$ can perform it independently of the environment. If $Q \xrightarrow{\mathbb{A}} r Q^{\prime}$, we write $Q \xrightarrow{1} Q^{\prime}$; we say that $Q$ performs a full time-step and often write $Q$ for $Q^{\prime}$. In [8], it is shown that inclusion of refusal traces characterises an efficiency preorder which is intuitively justified by a testing scenario. In the present paper, we need partial time steps only to set up the following SOS-semantics; our real interest is in runs where all time steps are full. We let $\lambda$ range over $\mathbb{A}_{\tau} \cup\{1\}$.

Definition 2.7 (refusal transitional semantics) The inference rules in Table 3 define $\xrightarrow{X}_{r} \subseteq \tilde{\mathbb{P}} \times \tilde{\mathbb{P}}$ where $X \subseteq \mathbb{A}$.

$$
\begin{aligned}
& \mathrm{NIL}_{t} \frac{}{\text { nil } \xrightarrow{X}_{r} \text { nil }} \quad \operatorname{PREF}_{t 1} \frac{}{\alpha . P \xrightarrow[\longrightarrow]{X}_{r} \underline{\alpha} \cdot P} \quad \operatorname{PreF}_{t 2} \frac{\alpha \notin X \cup\{\tau\}}{\underline{\alpha} \cdot P \xrightarrow{X}_{r} \underline{\alpha} \cdot P} \\
& \operatorname{READ}_{t 1} \frac{Q \xrightarrow{X}_{r} Q^{\prime}}{\alpha \triangleright Q \xrightarrow{X}_{r} \underline{\alpha} \triangleright Q^{\prime}} \quad \operatorname{READ}_{t 2} \frac{Q \xrightarrow{X}_{r} Q^{\prime}, \alpha \notin X \cup\{\tau\}}{\underline{\alpha} \triangleright Q \xrightarrow{X}_{r} \underline{\alpha} \triangleright Q^{\prime}} \\
& \operatorname{Sum}_{t} \frac{Q_{i} \xrightarrow[\rightarrow]{X} Q_{i}^{\prime} \text { for } i=1,2}{Q_{1}+Q_{2} \xrightarrow[\rightarrow]{X}_{r} Q_{1}^{\prime}+Q_{2}^{\prime}} \quad \operatorname{ReL}_{t} \frac{Q \xrightarrow{\Phi^{-1}(X \cup\{\tau\}) \backslash\{\tau\}}{ }_{r} Q^{\prime}}{Q[\Phi] \xrightarrow{X}_{r} Q^{\prime}[\Phi]} \quad \operatorname{Rec}_{t} \frac{Q \xrightarrow{X}_{r} Q^{\prime}}{\text { rec } x . Q \xrightarrow{X}_{r} \text { rec } x \cdot Q^{\prime}} \\
& \mathrm{PAR}_{t} \frac{Q_{i} \xrightarrow{X_{i}}{ }_{r} Q_{i}^{\prime} \text { for } i=1,2, X \subseteq\left(A \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash A\right)}{Q_{1} \|_{A} Q_{2} \xrightarrow{X}_{r} \operatorname{clean}\left(Q_{1}^{\prime} \|_{A} Q_{2}^{\prime}\right)}
\end{aligned}
$$

Table 3: Refusal transitional semantics of $\mathrm{PAFAS}_{r}$ processes

Rule $\operatorname{Pref}_{t_{1}}$ says that a process $\alpha . P$ can let time pass and refuse to perform any action while rule $\operatorname{Pref}_{t_{2}}$ says that a process $\underline{\alpha} . P$ can let time pass but cannot refuse the action $\alpha$. Process $\underline{\underline{\tau}} . P$ cannot let time pass and cannot refuse any action; in any context, $\tau . P$ has to perform $\tau$ before time can pass further. Rule $\mathrm{PAR}_{t}$ defines which actions a parallel composition can refuse during a time-step. The intuition is that $Q_{1} \|_{A} Q_{2}$ can refuse an action $\alpha$ if either $\alpha \notin A$ ( $Q_{1}$ and $Q_{2}$ can do $\alpha$ independently) and both $Q_{1}$ and $Q_{2}$ can refuse $\alpha$, or $\alpha \in A\left(Q_{1}\right.$ and $Q_{2}$ are forced to synchronise on $\alpha$ ) and at least one of $Q_{1}$ and $Q_{2}$ can refuse $\alpha$, i.e. can delay it. Thus, an action in a parallel composition is urgent (cannot be further delayed) only when all synchronising 'local' actions are urgent (also in this case we unmark the inactive urgencies). The other rules are as expected.

Example 2.8 As an example for the definitions given so far, consider $P=\left(R \|_{\emptyset} W\right) \|_{\{r, w\}} V$, where $V=$ rec $x .(r . x+w \cdot x), R=$ rec $x . r . x$ and $W=$ rec $x . w \cdot x$ model a variable (with values abstracted away), and the activities of repeatedly reading and writing such a variable, respectively. According to our operational semantics, $V \xrightarrow{\underline{V}} \underline{V}=\operatorname{rec} x .(\underline{r} \cdot x+\underline{w} \cdot x) \stackrel{r}{\mapsto} V$ (each occurrence of $x$ is replaced by $V$ before the second transition by using unmark); hence $\mathrm{REC}_{o}$ meets the usual intuition. Furthermore:

$$
P \xrightarrow{1}\left(\underline{R} \|_{\emptyset} \underline{W}\right)\left\|_{\{r, w\}} \underline{V}=\left((\operatorname{rec} x \cdot \underline{r} \cdot x) \|_{\emptyset}(\operatorname{rec} x \cdot \underline{w} \cdot x)\right)\right\|_{\{r, w\}} \operatorname{rec} x .(\underline{r} \cdot x+\underline{w} \cdot x) \stackrel{r}{\mapsto} P .
$$

To explain the first transition, process $P$ can synchronise either on action $r$ or on action $w$. Both actions are activated so that they become urgent after the first time-step. The second transition models the execution of action $r$ by synchronising $\underline{R}$ and $\underline{V}$. These processes evolve into $R$ and $V$, respectively. As a side effect, the urgent $w$ in $\underline{W}$ loses its urgency since its synchronisation partner $V$ offers a new, non-urgent synchronisation. At this stage, it is function clean in Definition 2.5 that effects this change. The above behaviour can be repeated, demonstrating that repeated reading can repeatedly delay and thus block $w$ indefinitely.

Alternatively, we can represent the variable in a such way that an occurrence of $r$ cannot disable the action $w$ (i.e. a process reading $V$ cannot block another process trying to write it). This can be done by modeling $r$ as non-blocking, i.e. $V^{\prime}=\operatorname{rec} x \cdot(r \triangleright(w . x))$. According to our operational rules, $V^{\prime} \xrightarrow{1} \underline{V}^{\prime}=\operatorname{rec} x .(\underline{r} \triangleright(\underline{w} \cdot x)) \stackrel{r}{\rightsquigarrow} \operatorname{rec} x .(\underline{r} \triangleright(\underline{w} \cdot x)) \stackrel{w}{\mapsto} V^{\prime}$. Hence:

$$
\begin{aligned}
P^{\prime} & \xrightarrow{1} \quad Q=\left(\underline{R} \|_{\emptyset} \underline{W}\right)\left\|_{\{r, w\}} \xrightarrow{V^{\prime}} \xrightarrow{r} Q^{\prime}=\left(\operatorname{rec} x . r \cdot x \|_{\emptyset} \operatorname{rec} x \cdot \underline{w} \cdot x\right)\right\|_{\{r, w\}} \operatorname{rec} x .(r \triangleright(\underline{w} \cdot x)) \xrightarrow{r} Q^{\prime} \\
& \left(R \|_{\emptyset} W\right) \|_{\{r, w\}} \operatorname{rec} x .(r \triangleright(w \cdot x))=P^{\prime}
\end{aligned}
$$

After the first occurrence of the action $r$ (corresponding to a synchronisation between $\underline{R}$ and $\underline{V}^{\prime}$ ),
$\underline{R}$ becomes $R$ and offers a new, non-urgent, instance of $r$ to its partner; this causes the unmarking of the urgent $r$ in $\underline{V}^{\prime}$. Once in $Q^{\prime}$, we can either perform an $r$-action, evolving again into $Q^{\prime}$, or perform an action $w$ and come back to $P^{\prime}$. But we cannot perform 1, i.e. $w$ is not delayed by $r$ in contrast to $P$ above. Moreover, from $Q$ we can also perform $w$ evolving directly to $P^{\prime}$. In this step, the urgent $r$ in $\underline{R}$ loses its urgency as above due to a new, non-urgent, synchronisation offered by $V^{\prime}$. Therefore, repeated writes can delay the action $r$ arbitrarily long, i.e. writing can still block reading.

Remark 2.9 To understand the impact of read-prefixes on the timed behaviour of concurrent systems more deeply, let us consider an example where two processes need to read the same value from a variable to prepare an output they produce together. As noted in the introduction, if we use non-blocking actions to model the variable, then such an output can be produced in at most two units of time. Indeed, by our operational semantics,

$$
\begin{aligned}
& \text { (r.o.nil } \left.\|_{\{o\}} r . o . n i l\right) \|_{\{r, w\}} \text { rec } x . r \triangleright w . x \xrightarrow{1}\left(\underline{r} . \text { o. nil } \|_{\{o\}} \underline{r} \text {.o.nil) } \|_{\{r, w\}} \text { rec } x . \underline{r} \triangleright w . x \xrightarrow{r}\right. \\
& \text { (o.nil } \left.\|_{\{o\}} \underline{r} . o . n i l\right) \|_{\{r, w\}} \text { rec } x . \underline{r} \triangleright w . x \xrightarrow{r}\left(o . n i l \|_{\{o\}} o . n i l\right) \|_{\{r, w\}} \text { rec } x . r \triangleright w . x \xrightarrow{1} \\
& \text { (o. nil } \|_{\{o\}} \underline{o} . \text { nil) } \|_{\{r, w\}} \text { rec } x . r \triangleright w . x \xrightarrow{o}
\end{aligned}
$$

If we use standard ordinary actions, then producing the output takes in the worst-case three units of time. Indeed:

$$
\begin{aligned}
& \text { (r.o.nil } \left.\|_{\{o\}} r . o . n i l\right) \|_{\{r, w\}} \text { rec } x .(r . x+w . x) \xrightarrow{1}\left(\underline{r} . \text { o.nil } \|_{\{o\} \underline{r} . o . n i l}\right) \|_{\{r, w\}} \text { rec } x .(\underline{r} . x+w . x) \xrightarrow{r} \\
& \text { (o.nil } \left.\|_{\{o\}} r . o . n i l\right) \|_{\{r, w\}} \text { rec } x .(r . x+w . x) \xrightarrow{1}\left(o . n i l \|_{\{o\}}^{\underline{r} . o . n i l}\right) \|_{\{r, w\}} \text { rec } x .(\underline{r} . x+w . x) \xrightarrow{r} \\
& \left(o . n i l \|_{\{o\}} o . n i l\right) \|_{\{r, w\}} \mathrm{rec} x .(r . x+w . x) \xrightarrow{1}\left(\underline{o} . \mathrm{nil}\left\|_{\{o\} \underline{o} . \mathrm{nil})}\right\|_{\{r, w\}} \mathrm{rec} x .(r . x+w . x) \xrightarrow{o}\right.
\end{aligned}
$$

The following proposition (proven in Appendix B) shows that all processes reachable from an initial one (which is obviously clean) are clean. Hence, all processes of interest to us are clean. The second item shows that a clean process that does not have to perform an action urgently (i.e. $\mathcal{U}(Q)=\emptyset)$ does not contain urgent actions syntactically.

Proposition 2.10 Let $Q \in \tilde{\mathbb{P}}$ be a clean process. Then:

1. $Q \xrightarrow{\alpha} Q^{\prime}$ or $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $Q^{\prime}$ clean;
2. $\mathcal{U}(Q)=\emptyset$ implies $Q \in \tilde{\mathbb{P}}_{1}$.

## 3 A read operator with a simpler semantics

In this section, we present a variation of the language $\mathrm{PAFAS}_{r}$ as it has been defined in Section 2. For this, we define a new kind of read operator $\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q$ with a slightly different syntax. The intuition is that in a term like $\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q$, the read-set $\left\{\mu_{1}, \ldots, \mu_{n}\right\}$ consists of all the reading actions currently enabled. In this way we try to avoid terms with nested reading actions and, as a consequence, we can describe the behaviour of these new $\mathrm{PAFAS}_{s}$ processes by means of a simpler timed operational semantics with just one type of action transitions. In particular, this makes it easier to implement the algorithm (described in Section 8.2) that detects violations of the liveness property of MUTEX algorithms by showing the existence of a special kind of cycles. A price to pay is that not all $\mathrm{PAFAS}_{s}$ processes have a reasonable semantics; but the subset with a reasonable semantics is practically expressive enough due to the set of reading actions.

Definition 3.1 (timed process terms) The set $\tilde{\mathbb{S}}_{1}$ of initial (timed) process terms is generated by the following grammar

$$
P::=\text { nil }|x| \alpha . P\left|\left\{\alpha_{1}, \ldots, \alpha_{n}\right\} \triangleright P\right| P+P\left|P \|_{A} P\right| P[\Phi] \mid \text { rec } x . P
$$

where nil is a constant, $x \in \mathcal{X}, \alpha \in \mathbb{A}_{\tau},\left\{\alpha_{1}, \ldots, \alpha_{n}\right\} \subseteq \mathbb{A}_{\tau}$ finite, $\Phi$ is a general relabelling function and $A \subseteq \mathbb{A}$ possibly infinite. The set $\widetilde{\mathbb{S}}$ of (general) (timed) process terms is generated by the following grammar:

$$
Q::=P|\underline{\alpha} \cdot P|\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q|Q+Q| Q \|_{B} Q|Q[\Phi]| \operatorname{rec} x . Q
$$

where $P \in \tilde{\mathbb{S}}_{1}, \alpha \in \mathbb{A}_{\tau}$ and $\left\{\mu_{1}, \ldots, \mu_{n}\right\}$ is a finite subset of $\mathbb{A}_{\tau} \cup \mathbb{A}_{\tau}$ such that for each $\alpha \in \mathbb{A}_{\tau}$, $\left|\{\alpha, \underline{\alpha}\} \cap\left\{\mu_{1}, \ldots, \mu_{n}\right\}\right| \leq 1$, i.e. $\left\{\mu_{1}, \ldots, \mu_{n}\right\}$ cannot contain two copies (one lazy and the other urgent) of the same action $\alpha$. Notice that terms not satisfying such a property are not reachable from initial ones anyway (see, Section 3.1). Again, $\Phi$ is a general relabelling function and $A \subseteq \mathbb{A}$ possibly infinite. We say that a variable $x \in \mathcal{X}$ is read-guarded in $Q$ if, for each subterm of $Q$ of the form $\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}, x$ is action-guarded in $Q_{1}$. In this section, we assume that recursion is action-guarded (as in Section 2) and read-guarded, i.e. for each term rec $x . Q$, the variable $x$ is read-guarded in $Q$. The set of closed timed process terms in $\tilde{\mathbb{S}}$ and $\tilde{\mathbb{S}}_{1}$, simply called processes and initial processes resp., is denoted by $\mathbb{S}$ and $\mathbb{S}_{1}$ resp.

In the following, we will focus on the so-called read-proper terms, which do have a reasonable semantics; we will prove this by relating them to $\mathrm{PAFAS}_{r}$ processes with the same behaviour. Read-proper terms only have "properly" nested reading behaviour, i.e. we want to avoid terms like $\{a\} \triangleright\{b\} \triangleright Q$ or $\{a\} \triangleright Q^{\prime}+\{b\} \triangleright Q$; these terms violate the intuition given above for the read-set operator. More formally, we say that $Q \in \tilde{\mathbb{S}}$ is read-guarded if every subterm of $Q$ of the form $\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q^{\prime}$ is in the scope of some $\mu$ (i.e. in some subterm $\mu$.()). A term $Q \in \tilde{\mathbb{S}}$ is readproper if each subterm $Q_{1}+Q_{2}$ is read-guarded and, for each subterm $\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}, Q_{1}$ is read-guarded. With this definition, neither $\{a\} \triangleright\{b\} \triangleright Q$ nor $\{a\} \triangleright Q^{\prime}+\{b\} \triangleright Q$ are read-proper, since the subterm $\{b\} \triangleright Q$ is not in the scope of some $\mu$ and, thus, also not read-guarded.

Definition 3.2 (urgent basic actions) Let $Q \in \tilde{\mathbb{S}}$ and $A \subseteq \mathbb{A}_{\tau}$. The set $\mathcal{U}(Q, A)$ is defined as in Definition 2.2 where the Read-rule is replaced by:

$$
\text { READ: } \mathcal{U}\left(\left\{\mu_{1}, \mu_{2}, \ldots, \mu_{n}\right\} \triangleright Q, A\right)=\left(\mathcal{U}\left(\left\{\mu_{1}, \mu_{2}, \ldots, \mu_{n}\right\}\right) \backslash A\right) \cup \mathcal{U}(Q, A)
$$

where $\mathcal{U}\left(\left\{\mu_{1}, \mu_{2}, \ldots, \mu_{n}\right\}\right)=\left\{\alpha \in \mathbb{A}_{\tau} \mid \underline{\alpha} \in\left\{\mu_{1}, \mu_{2}, \ldots, \mu_{n}\right\}\right\}$
Definition 3.3 (cleaning inactive urgencies) For $Q \in \tilde{\mathbb{S}}$, we define clean $(Q, A)$ as in Definition 2.3, where the Read-rule is replaced by the following one. Again, we define clean $(Q)$ as clean $(Q, \emptyset)$.

$$
\text { Read: } \quad \operatorname{clean}\left(\left\{\mu_{1}, \mu_{2}, \ldots, \mu_{n}\right\} \triangleright Q, A\right)=\left\{\nu_{1}, \nu_{2}, \ldots, \nu_{n}\right\} \triangleright \operatorname{clean}(Q, A)
$$

where $\left\{\nu_{1}, \nu_{2}, \ldots, \nu_{n}\right\}$ is the read-set we obtain from $\left\{\mu_{1}, \mu_{2}, \ldots, \mu_{n}\right\}$ by unmarking all urgencies in $A$; in more detail, for each $i \in[1, n], \mu_{i} \in\{\alpha, \underline{\alpha}\}$ implies either (i) $\alpha \in A$ and $\nu_{i}=\alpha$, or (ii) $\alpha \notin A$ and $\nu_{i}=\mu_{i}$.

The definition for the function $\operatorname{unmark}(Q)$ for $Q \in \tilde{\mathbb{S}}$ is omitted.

### 3.1 The timed operational semantics of PAFAS $_{s}$ processes

Now, we describe the transitional semantics describing the functional behaviour and the temporal behaviour of $\mathrm{PAFAS}_{s}$ terms.

Definition 3.4 (Functional operational semantics) The SOS-rules defining the transition relations $\xrightarrow{\alpha} \subseteq(\tilde{\mathbb{S}} \times \widetilde{\mathbb{S}})$ (the action transitions) are those in Table $1^{2}$ where we replace the rule READ $_{o}$ with:

$$
\operatorname{READ}_{s 1} \frac{\mu_{i} \in\{\alpha, \underline{\alpha}\}}{\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q \stackrel{\alpha}{\rightarrow}\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q} \quad \operatorname{READ}_{s 2} \frac{Q \xrightarrow{\alpha} Q^{\prime}}{\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q \xrightarrow{\alpha} Q^{\prime}}
$$

[^1]Definition 3.5 (refusal transitional semantics) The inference rules defining the transition relation ${ }^{X}{ }_{r} \subseteq \tilde{\mathbb{S}} \times \tilde{\mathbb{S}}$ where $X \subseteq \mathbb{A}$ are those in Table 3 where we replace the rules $\operatorname{READ}_{t 1}$ and $\operatorname{READ}_{t 2}$ with

$$
\operatorname{READ}_{t} \frac{Q \xrightarrow[\rightarrow]{X}_{r} Q^{\prime}, \mathcal{U}\left(\left\{\mu_{1}, \ldots, \mu_{n}\right\}\right) \cap(X \cup\{\tau\})=\emptyset}{\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q \xrightarrow{X}_{r} \underline{\left\{\mu_{1}, \ldots, \mu_{n}\right\}} \triangleright Q^{\prime}}
$$

where $\underline{\left\{\mu_{1}, \ldots, \mu_{n}\right\}}$ is obtained from $\left\{\mu_{1}, \ldots, \mu_{n}\right\}$ by replacing each $\alpha$ by $\underline{\alpha}$.
An essential idea of reading is that it does not change the state of a process and therefore does not block other actions. With the above operational semantics, we have $\{a\} \triangleright\{b\} \triangleright Q \xrightarrow{b}\{b\} \triangleright Q$ as well as $\{a\} \triangleright Q^{\prime}+\{b\} \triangleright Q \xrightarrow{b}\{b\} \triangleright Q$, violating this idea; therefore, we exclude such processes.

## 4 Mapping $\operatorname{PAFAS}_{s}$ into PAFAS $_{r}$

This section studies the expressiveness of the process description languages we have introduced above. As a first result, Theorem 4.3 shows that for each read-proper $Q \in \tilde{\mathbb{S}}$ there exists a corresponding term in $\tilde{\mathbb{P}}$ whose behaviour is bisimilar and even isomorphic to that of $Q$; see Appendix C for the proof of Theorem 4.3 and some other related results. On the inverse claim (i.e. each PAFAS $r$ term can be translated into a bisimilar read-proper $\mathrm{PAFAS}_{s}$ term) we will comment below.

We start by providing a translation function $\llbracket-\rrbracket$ that maps terms in $\widetilde{\mathbb{S}}$ to corresponding terms in $\tilde{\mathbb{P}}$; to regard $\llbracket-\rrbracket$ as a function in the read-case, we have to assume that actions are totally ordered, and that the actions of a read-set are listed according to this order.

Definition 4.1 (a translation function) For $Q \in \tilde{\mathbb{S}}, \llbracket Q \rrbracket$ is defined by induction on $Q$ as follows:

| Nil, Var, Pref: | $\llbracket$ nil $\rrbracket=$ nil $, \quad \llbracket x \rrbracket=x, \quad \llbracket \mu \cdot P \rrbracket=\mu \cdot \llbracket P \rrbracket$ |
| :--- | :--- |
| Read: | $\llbracket\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q \rrbracket=\mu_{1} \triangleright \ldots \triangleright \mu_{n} \triangleright \llbracket Q \rrbracket$ |
| Sum: | $\llbracket Q_{1}+Q_{2} \rrbracket=\llbracket Q_{1} \rrbracket+\llbracket Q_{2} \rrbracket$ |
| Par: | $\llbracket Q_{1}\left\\|_{A} Q_{2} \rrbracket=\llbracket Q_{1} \rrbracket\right\\|_{A} \llbracket Q_{2} \rrbracket$ |
| Rel: | $\llbracket Q[\Phi \rrbracket \rrbracket=\llbracket Q \rrbracket \Phi \rrbracket$ |
| Rec: | $\llbracket$ rec $x \cdot Q \rrbracket=\operatorname{rec} x . \llbracket Q \rrbracket$ |

Observe that $\llbracket \rrbracket$ is injective on read-proper terms; except for the read-case, this is easy since $\llbracket \rrbracket$ preserves all other operators. In the read case, $Q$ is read-guarded, i.e. the top-operator of $Q$ and $\llbracket Q \rrbracket$ is not $\triangleright$; hence, the read-set can be read off from $\llbracket\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q \rrbracket$ as the maximal sequence of $\triangleright$-prefixes the term starts with. With this observation, the following two results show that $\llbracket \rrbracket$ is an isomorphism between labelled transition systems, if we restrict it on the one hand to read-proper terms and their transitions and on the other to the images of read-proper terms and the transitions of these images. As a prerequisite for this, the first result states that the set of read-proper terms is closed w.r.t. our timed operational semantics.

Proposition 4.2 Let $Q \in \tilde{\mathbb{S}}$ be read-proper. Then: $Q \xrightarrow{\alpha} Q^{\prime}$ or $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $Q^{\prime}$ is read-proper.
Theorem 4.3 For all read-proper $Q \in \tilde{\mathbb{S}}$ :

1. $Q \xrightarrow{\alpha} Q^{\prime}\left(Q \xrightarrow{X}{ }_{r} Q^{\prime}\right)$ implies $\llbracket Q \rrbracket \xrightarrow{\alpha} \llbracket Q^{\prime} \rrbracket\left(\llbracket Q \rrbracket \xrightarrow{X}_{r} \llbracket Q^{\prime} \rrbracket\right)$
2. if $\llbracket Q \rrbracket \xrightarrow{\alpha} Q^{\prime \prime}\left(\llbracket Q \rrbracket \xrightarrow{X}_{r} Q^{\prime \prime}\right)$ then $Q \xrightarrow{\alpha} Q^{\prime}\left(Q \xrightarrow{X}_{r} Q^{\prime}\right)$ with $\llbracket Q^{\prime} \rrbracket=Q^{\prime \prime}$

For our application, it would be sufficient to prove that the full time steps of $Q$ are matched; but it is hard to imagine a proof for this that does not also give the matches for all time steps.

It is not clear yet whether the inverse claim (i.e. that each $\mathrm{PAFAS}_{r}$ term can be translated into a bisimilar read-proper $\mathrm{PAFAS}_{s}$ term) holds. Just to give an idea of the difficulties, consider the $\mathrm{PAFAS}_{r}$ process $a \triangleright\left(b \triangleright c\right.$.nil $\|_{\emptyset} d$.nil); here, reading is not properly nested as in the images of $\left.\mathbb{\llbracket}\right]$. Surprisingly, this process has the same timed behaviour as ( $a \triangleright b \triangleright c$.nil) $\|_{\{a\}}(a \triangleright d$.nil), which is the translation of the read-proper $\tilde{\mathbb{S}}$ process $\{a, b\} \triangleright c$.nil $\|_{\{a\}}\{a\} \triangleright d$.nil. Hence, the proof idea for the inverse claim could be to find a transformation of arbitrary $\mathrm{PAFAS}_{r}$ terms to 'properly nested' ones. Unfortunately, this seems hard for the term $a \triangleright\left(b \triangleright c\right.$.nil $\|_{\emptyset} a$.nil); probably, we should exclude terms from consideration that are ill-formed in the sense that, in some subterm $a \triangleright Q, a$ appears as an ordinary prefix in $Q$. So the inverse claim is still under investigation.

## 5 Fairness and PAFAS ${ }_{r}$

In this section we briefly describe our theory of fairness. It closely follows Costa and Stirling's theory of (weak) fairness. The main ingredients of the theory are:

- A labelling for process terms. This allows to detect during a transition which action is actually performed; e.g., for process $P=$ rec $x . \alpha . x$, we need additional information to detect whether the left-hand side instance of action $\alpha$ or the right-hand one is performed in the transition $P\left\|_{\emptyset} P \xrightarrow{\alpha} P\right\|_{\emptyset} P$. When an action is performed, we speak of an event, which corresponds to a label - or actually, different from [10, 9], a duple of labels as we will see.
- Live events. An action of a process term is live if it can currently be performed. In a term like $a . b$.nil $\|_{\{b\}} b$.nil only action $a$ can be performed while $b$ cannot, momentarily. Such a live action corresponds to a possible event, i.e. to a label.
- Fair sequences. A maximal sequence is fair when no event in a process term becomes live and then remains live throughout.

These items sketch the general methodology used by Costa and Stirling to define and isolate fair computations in $[10,9]$. We now describe the three items in more detail. The definitions in the rest of this section generalise those in [4], which were mostly taken from [9] with the obvious slight variations due to the different language we are using (the timed process algebra PAFAS ${ }_{r}$ with TCSP parallel composition instead of CCS). We also take from [9] those results that are language independent. The others will be proven.

### 5.1 A labelling for process terms

In order to determine the fairness of a transition sequence, Costa and Stirling use a labelling method. Labels are associated with basic actions and operators inside a process. Along a computation, labels are unique and, once a label disappears, it will not reappear in the process anymore. The set of labels is $\mathrm{LAB}=\{1,2\}^{*}$ with $\varepsilon$ as the empty label and $u, v, w, \ldots$ as typical elements; $\leq$ is the prefix preorder on LAB. We have that $u \leq v$ if there is $u^{\prime} \in \operatorname{LAB}$ such that $v=u u^{\prime}$ (and $u<v$ if $\left.u^{\prime} \in\{1,2\}^{+}\right)$. We also use the following notation:

- (Set of tuples) $\mathcal{N}=\left\{\left\langle v_{1}, \ldots, v_{n}\right\rangle \mid n \geq 1, v_{1}, \ldots, v_{n} \in \mathrm{LAB}\right\} ;$
- (Composition of tuples) $s_{1} \times s_{2}=\left\langle v_{1}, \ldots, v_{n}, w_{1}, \ldots, w_{m}\right\rangle$, where $s_{1}, s_{2} \in \mathcal{N}$ and $s_{1}=$ $\left\langle v_{1}, \ldots, v_{n}\right\rangle, s_{2}=\left\langle w_{1}, \ldots, w_{m}\right\rangle ;$
- (Composition of sets of tuples) $N \times M=\left\{s_{1} \times s_{2} \mid s_{1} \in N\right.$ and $\left.s_{2} \in M\right\}$, where $N, M \subseteq \mathcal{N}$. Note that $N=\emptyset$ or $M=\emptyset$ implies $N \times M=\emptyset$.

All $\mathrm{PAFAS}_{r}$ operators and variables will now be labelled in such a way that no label occurs more than once in an expression. We call this property unicity of labels. As indicated above, an action being performed might correspond to a pair or more generally to a tuple of labels, namely if it is a synchronisation; cf. the definition of live events below (5.7); therefore, we call tuples of labels event labels. Labels (i.e. elements of LAB) are assigned systematically following the structure of PAFAS $_{r}$ terms usually as indices and in case of parallel composition as upper indices. Due to recursion the labelling is dynamic: the rule for rec generates new labels.

Definition 5.1 (labelled process algebra) The labelled process algebra $L(\tilde{\mathbb{P}})$ (and similarly $\mathrm{L}\left(\tilde{\mathbb{P}}_{1}\right)$ etc.) is defined as $\bigcup_{u \in \operatorname{LAB}} \mathrm{~L}_{u}(\tilde{\mathbb{P}})$, where $\mathrm{L}_{u}(\tilde{\mathbb{P}})=\bigcup_{Q \in \tilde{\mathbb{P}}} \mathrm{~L}_{u}(Q)$ and $\mathrm{L}_{u}(Q)$ is defined as follows:

Nil, Var: $\quad \mathrm{L}_{u}\left(\right.$ nil $\left.^{\prime}\right)=\left\{\right.$ nil $\left._{u}\right\}, \quad \mathrm{L}_{u}(x)=\left\{x_{u}\right\}$
In examples, we will often write nil for nil $_{u}$, if the label $u$ is not relevant.
Pref: $\quad \mathrm{L}_{u}(\mu . P)=\left\{\mu_{u} \cdot P^{\prime} \mid P^{\prime} \in \mathrm{L}_{u 1}(P)\right\}$
Read: $\quad \mathrm{L}_{u}(\mu \triangleright Q)=\left\{\mu_{u 1} \triangleright_{u} Q^{\prime} \mid Q^{\prime} \in \mathrm{L}_{u 2}(Q)\right\}$
Sum: $\quad \mathrm{L}_{u}\left(Q_{1}+Q_{2}\right)=\left\{Q_{1}^{\prime}+_{u} Q_{2}^{\prime} \mid Q_{1}^{\prime} \in \mathrm{L}_{u 1}\left(Q_{1}\right), Q_{2}^{\prime} \in \mathrm{L}_{u 2}\left(Q_{2}\right)\right\}$
Par: $\quad \mathrm{L}_{u}\left(Q_{1} \|_{A} Q_{2}\right)=\left\{Q_{1}^{\prime} \|_{A}^{u} Q_{2}^{\prime} \mid Q_{1}^{\prime} \in \mathrm{L}_{u 1 v}\left(Q_{1}\right), Q_{2}^{\prime} \in \mathrm{L}_{u 2 v^{\prime}}\left(Q_{2}\right)\right.$ where $\left.v, v^{\prime} \in \mathrm{LAB}\right\}$
Rel: $\quad \mathrm{L}_{u}(Q[\Phi])=\left\{Q^{\prime}\left[\Phi_{u}\right] \mid Q^{\prime} \in \mathrm{L}_{u 1 v}(Q)\right.$ where $\left.v \in \mathrm{LAB}\right\}$
Rec: $\quad \mathrm{L}_{u}(\operatorname{rec} x \cdot Q)=\left\{\operatorname{rec} x_{u} \cdot Q^{\prime} \mid Q^{\prime} \in \mathrm{L}_{u 1}(Q)\right\}$
We assume that, in rec $x_{u} \cdot Q$, rec $x_{u}$ binds all free occurrences of a labelled $x$. We let $\mathrm{L}(Q)=$ $\bigcup_{u \in \mathrm{LAB}} \mathrm{L}_{u}(Q)$ and $\mathrm{LAB}(Q)$ is the set of labels occurring in $Q$.

The unicity of labels must be preserved under derivation. For this reason in the rec rule the standard substitution must be replaced by a substitution operation which also changes the labels of the substituted expression.

Definition 5.2 (a new substitution operator) The new substitution operation, denoted by $\{\mid$ - $\}$, is defined on $\mathrm{L}(\tilde{\mathbb{P}})$ using the following operators:
i. ()$^{+v}$ If $Q \in \mathrm{~L}_{u}(\tilde{\mathbb{P}})$, then $(Q)^{+v} \in \mathrm{~L}_{v u}(\tilde{\mathbb{P}})$ obtained by prefixing $v$ to all labels in $Q$.
ii. $\quad()_{\varepsilon}$ If $Q \in \mathrm{~L}_{u}(\tilde{\mathbb{P}})$, then $(Q)_{\varepsilon}$ is the term in $\mathrm{L}_{\varepsilon}(\tilde{\mathbb{P}})$ obtained by removing the prefix $u$ from all labels in $Q$. (Note that $u$ is the unique prefix-minimal label in $Q$.)

Suppose $Q, Q^{\prime} \in \mathrm{L}(\tilde{\mathbb{P}})$ and $x_{u}, \ldots, x_{v}$ are all free occurrences of a labelled $x$ in $Q$ then $Q\left\{\left|Q^{\prime}\right| x \mid\right\}=$ $Q\left\{\left(\left(Q^{\prime}\right)_{\varepsilon}\right)^{+u} / x_{u}, \ldots,\left(\left(Q^{\prime}\right)_{\varepsilon}\right)^{+v} / x_{v}\right\}$. The motivation of this definition is that in $Q\left\{Q^{\prime} / x\right\}$ each substituted $Q^{\prime}$ inherits the label of the $x$ it replaces.

The relationship between activated and urgent actions of PAFAS $_{r}$ and of labelled PAFAS $_{r}$ processes is easy. We can simply define $\mathcal{U}(Q, A)$ and $\mathcal{A}(Q, A)$ for a labelled PAFAS $_{r}$ process $Q$ just as in Definitions 2.6 and 2.2, resp. Indeed, labels are just annotations used to distinguish different instances of the same basic action and they do not interfere with the notions of activated and urgent actions. Similarly, the operation of removing urgencies, inactive or not, does not depend on labels. They are performed in the same way both in the unlabelled and labelled setting and can be defined as in Section 2.

Finally, the behavioural operational semantics of the labelled $\mathrm{PAFAS}_{r}$ is obtained by replacing the rule $\mathrm{REC}_{o}$ in Definition 2.5 with the rule:

$$
\operatorname{Rec}_{o} \frac{Q\left\{\mid \operatorname{rec} x_{u} \cdot \operatorname{unmark}(Q) / x\right\} \stackrel{\alpha}{\mapsto} Q^{\prime}}{\operatorname{rec} x_{u} \cdot Q \stackrel{\alpha}{\rightarrow} Q^{\prime}}
$$

In the other rules we ignore the labels, but keep the labels of a static operator where $\triangleright$ is "partly" static; e.g we have the rules removed clean:

$$
\operatorname{Pref}_{o} \frac{\mu \in\{\alpha, \underline{\alpha}\}}{\mu_{u} \cdot P \stackrel{\alpha}{\mapsto} P} \quad \operatorname{Read}_{r_{1}} \frac{\mu \in\{\alpha, \underline{\alpha}\}}{\mu_{u 1} \triangleright_{u} Q \stackrel{\alpha}{\rightsquigarrow} \mu_{u 1} \triangleright_{u} Q}
$$

because we assume that labels are not observable when actions are performed. As a consequence, a labelled term $Q$ and its unlabelled version, that we denote with $\mathrm{R}(Q)$, can perform exactly the same transitions, as stated by the following proposition.

Proposition 5.3 Let $Q \in \mathrm{~L}_{u}(\tilde{\mathbb{P}})$ and $A \subseteq \mathbb{A}_{\tau}$. Then:
i. $Q \xrightarrow{\alpha} Q_{\sim}^{\prime}\left(Q \xrightarrow{X}{ }_{r} Q^{\prime}\right)$ implies $\mathrm{R}(Q) \xrightarrow{\alpha} \mathrm{R}\left(Q^{\prime}\right)\left(\mathrm{R}(Q) \xrightarrow{X} r \mathrm{R}\left(Q^{\prime}\right)\right)$ in unlabelled $\mathrm{PAFAS}_{r}$ and $Q^{\prime} \in \mathrm{L}(\tilde{\mathbb{P}}) ;$
ii. if $\mathrm{R}(Q) \xrightarrow{\alpha} R\left(\mathrm{R}(Q) \xrightarrow{X}_{r} R\right)$ in unlabelled $\mathrm{PAFAS}_{r}$ then for some $Q^{\prime}$ with $R=\mathrm{R}\left(Q^{\prime}\right)$, we have $Q \xrightarrow{\alpha} Q^{\prime}\left(Q \xrightarrow{X}{ }_{r} Q^{\prime}\right)$;
iii. $\mathcal{A}(Q, A)=\mathcal{A}(\mathrm{R}(Q), A)$ and $\mathcal{U}(Q, A)=\mathcal{U}(\mathrm{R}(Q), A)$.

As an example for 5.3 (ii), observe that for $a \cdot$ nil $\|_{\emptyset}$ nil $\xrightarrow{a}$ nil $\|_{\emptyset}$ nil and $\mathrm{R}\left(a_{u 1} \cdot\right.$ nil $_{u 11} \|_{\emptyset}^{u}$ nil $\left._{u 2}\right)=$ $a$.nil $\|_{\emptyset}$ nil we indeed have $a_{u 1} \cdot$ nil $_{u 11} \|_{\emptyset}^{u}$ nil $_{u 2} \xrightarrow{a}$ nil $_{u 11} \|_{\emptyset}^{u}$ nil ${ }_{u 2}$; the latter term is a labelled process since we allow $Q_{1}^{\prime} \in \mathrm{L}_{u 1 v}\left(Q_{1}\right)$ in case Par of Definition 5.1, while for example in case Pref we require $P^{\prime} \in \mathrm{L}_{u 1}(P)$.
The next facts are an immediate consequence of the labelling. We omit the proofs since they are a trivial extension of similar results in [9] and can be easily proven by induction on terms in $\mathrm{L}(\tilde{\mathbb{P}})$.

Fact 5.4 Let $Q \in \mathrm{~L}_{u}(\tilde{\mathbb{P}})$. Then:

1. no label occurs more than once in $Q$,
2. $w \in \operatorname{LAB}(Q)$ implies $u \leq w$.

Central to labelling is the persistence and disappearance of labels under derivation. In particular, once a label disappears it can never reappear. It is these features which allow us to recognise when a component contributes to the performance of an action.

Fact 5.5 Let $Q \in \mathrm{~L}_{u}(\tilde{\mathbb{P}})$ and $\alpha, \alpha_{1}, \ldots, \alpha_{n} \in \mathbb{A}_{\tau}$. Then:

1. $Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$ implies $Q^{\prime} \in \mathrm{L}_{u}(\tilde{\mathbb{P}})$. Moreover $\operatorname{LAB}\left(Q^{\prime}\right)=\operatorname{LAB}(Q)$;
2. $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ implies $Q^{\prime} \in \mathrm{L}_{v}(\tilde{\mathbb{P}})$ with $u \leq v$;
3. $Q=Q_{0} \xrightarrow{\alpha_{1}} Q_{1} \xrightarrow{\alpha_{2}} \ldots \xrightarrow{\alpha_{n}} Q_{n}$ implies $Q_{i} \in \mathrm{~L}_{v_{i}}(\tilde{\mathbb{P}})$ with $u \leq v_{i}$. Moreover, if $w \in \mathrm{LAB}$ such that $w<u$ then $w \notin \operatorname{LAB}\left(Q_{i}\right)$.

Fact 5.6 Let $Q_{0} \in \mathrm{~L}(\tilde{\mathbb{P}})$. If $Q_{0} \xrightarrow{\alpha_{1}} Q_{1} \xrightarrow{\alpha_{2}} \ldots \xrightarrow{\alpha_{i}} Q_{i} \xrightarrow{\alpha_{i+1}} \ldots \xrightarrow{\alpha_{n}} Q_{n}$ and $v \in \operatorname{LAB}\left(Q_{0}\right) \cap \operatorname{LAB}\left(Q_{n}\right)$ then $v \in \operatorname{LAB}\left(Q_{i}\right)$, for every $i \in[0, n]$.

Throughout the rest of this section we assume the labelled calculus. However, whenever possible, labels will be left implicit to keep the notation simple (as, for instance, in proofs of statements that do not explicitly deal with labels in processes) and the same applies for the treatment of labelled processes in the next section.

### 5.2 Live events

To capture the fairness constraint for execution sequences, we need to define the live events. For $\alpha_{u}$.nil $\|_{\{\alpha\}} \alpha_{v}$.nil (with labels $u$ and $v$ ), there is only one live action. This is action $\alpha$; it can be performed in only one way, i.e. there is only one $\alpha$-event, which we will identify with the tuple $\langle u, v\rangle$, i.e. with the tuple of labels of 'local' $\alpha$ 's that synchronise when the process performs $\alpha$; recall that we call such tuples event labels. ${ }^{3}$ Similarly, there is only one live action in $\alpha_{u} \cdot \beta_{v}$.nil $\|_{\{\beta\}} \beta_{y}$.nil (action $\alpha$ corresponding to tuple $\langle u\rangle$ ) because the parallel composition prevents the instance of $\beta$ labelled by $\langle y\rangle$ from contributing an action. However, $\langle v, y\rangle$ becomes live, once action $\alpha$ is performed.

We now define $\operatorname{LE}(Q, A)$ as the set of live events of $Q$ (when the execution of actions in $A$ are prevented by the environment). Again for technical reasons, we allow $\tau$ to be part of $A$.

Definition 5.7 (live events) Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}}), A \subseteq \mathbb{A}_{\tau}$. The set $\mathrm{LE}(Q, A)$ is defined below by induction on $Q$. The set of live events in $Q$ is defined as $\operatorname{LE}(Q, \emptyset)$ which we abbreviate to $\operatorname{LE}(Q)$.

Nil, Var: $\quad \operatorname{LE}\left(\right.$ nil $\left._{u}, A\right)=\operatorname{LE}\left(x_{u}, A\right)=\emptyset$
Pref: $\quad \operatorname{LE}\left(\mu_{u} \cdot P, A\right)=\left\{\begin{array}{cc}\{\langle u\rangle\} & \text { if } \mu \in\{\alpha, \underline{\alpha}\} \text { and } \alpha \notin A \\ \emptyset & \text { otherwise }\end{array}\right.$
Read: $\quad \operatorname{LE}\left(\mu_{v} \triangleright_{u} Q, A\right)=\left\{\begin{array}{cc}\{\langle v\rangle\} \cup \operatorname{LE}(Q, A) & \text { if } \mu \in\{\alpha, \underline{\alpha}\} \text { and } \alpha \notin A \\ \operatorname{LE}(Q, A) & \text { otherwise }\end{array}\right.$
Sum: $\quad \operatorname{LE}\left(Q_{1}+{ }_{u} Q_{2}, A\right)=\operatorname{LE}\left(Q_{1}, A\right) \cup \operatorname{LE}\left(Q_{2}, A\right)$
Par: $\quad \operatorname{LE}\left(Q_{1} \|_{B}^{u} Q_{2}, A\right)=\bigcup_{i=1,2} \operatorname{LE}\left(Q_{i}, A \cup B\right) \cup \bigcup_{\alpha \in B \backslash A} \operatorname{LE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{LE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$
Rel: $\quad \operatorname{LE}\left(Q\left[\Phi_{u}\right], A\right)=\operatorname{LE}\left(Q, \Phi^{-1}(A)\right)$
Rec: $\quad \operatorname{LE}\left(\operatorname{rec} x_{u} \cdot Q, A\right)=\operatorname{LE}(Q, A)$
Also in this case, the set $A$ represents the restricted actions. Then, $\operatorname{LE}\left(a_{u} \cdot P,\{a\}\right)$ must be empty because the action $a$ is prevented. Note that, in the Par-case, $\operatorname{LE}\left(Q_{1}, A \cup B\right) \cup \operatorname{LE}\left(Q_{2}, A \cup B\right)$ is the set of the labels of the live actions of $Q_{1}$ and $Q_{2}$, when the environment prevents actions from $A$ and from $B$, corresponding to those actions that $Q_{1}$ and $Q_{2}$ can perform independently. To properly deal with synchronisation, for all $\alpha \in B \backslash A$ we combine each live event of $Q_{1}$ corresponding to $\alpha$ with each live event of $Q_{2}$ corresponding to $\alpha$, getting tuples of labels.

An important subset of the live events of a process $Q$ is the subset of urgent live events, that is, those that cannot be delayed anymore.

Definition 5.8 (urgent live events) Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$ and $A \subseteq \mathbb{A}_{\tau}$. The set $\mathrm{UE}(Q, A)$ is defined as in Definition 5.7 when $\operatorname{LE}(-)$ is replaced by $\operatorname{UE}(-)$ and rules Pref and Read are replaced as follows. The set set of urgent event of $Q$ is defined as $\operatorname{UE}(Q)=\operatorname{UE}(Q, \emptyset)$
Pref: $\quad \operatorname{UE}\left(\mu_{u} \cdot P, A\right)=\left\{\begin{array}{cc}\{\langle u\rangle\} & \text { if } \mu=\underline{\alpha} \text { and } \alpha \notin A \\ \emptyset & \text { otherwise }\end{array}\right.$
Read: $\quad \operatorname{UE}\left(\mu_{v} \triangleright_{u} Q, A\right)=\left\{\begin{array}{cc}\{\langle v\rangle\} \cup \mathrm{UE}(Q, A) & \text { if } \mu=\underline{\alpha} \text { and } \alpha \notin A \\ \operatorname{UE}(Q, A) & \text { otherwise }\end{array}\right.$
An easy observation is the following lemma.
Lemma 5.9 Let $Q$ be a labelled process term. Then:

1. $\mathrm{UE}(Q, A) \subseteq \mathrm{LE}(Q, A)$, for every $A \subseteq \mathbb{A}_{\tau}$.
2. $\left\langle v_{1}, \ldots, v_{n}\right\rangle \in \operatorname{LE}(Q)$ implies $v_{i} \in \operatorname{LAB}(Q)$, for every $i \in[1, n]$.

[^2]3. $Q \in \mathrm{~L}\left(\tilde{\mathbb{P}}_{1}\right)$ implies $\mathrm{UE}(Q, A)=\emptyset$, for every $A \subseteq \mathbb{A}_{\tau}$.

In the rest of this section we just state some properties useful to prove our main correspondence results. Detailed proofs have been moved into the appendixes. We start with a proposition relating labels and (functional and temporal) transitions which will be used to prove Proposition 6.1. In the case of functional transitions, if an event label is urgent and live in the source process, then either the label preserves its status in the target one or one of its constituents disappears (a similar statement would hold for live events in place of urgent ones). In the case of temporal transitions the set of live events of the source state coincides with the set of live events of the target one. In addition, after the temporal move all live events become urgent.

Proposition 5.10 Let $Q, Q^{\prime} \in \mathrm{L}(\tilde{\mathbb{P}})$ and $A \subseteq \mathbb{A}_{\tau}$. Then:

1. $Q \xrightarrow{\alpha} Q^{\prime}$ and $s=\left\langle v_{1}, \ldots, v_{n}\right\rangle \in \mathrm{UE}(Q, A)$ implies either $s \in \mathrm{UE}\left(Q^{\prime}, A\right)$ or there exists some $j \in[1, n]$ such that $v_{j} \notin \mathrm{LAB}\left(Q^{\prime}\right)$;
2. $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)$.

The next proposition relates full time-steps and urgent activated actions. A process term can perform a full time-step only if it does not have any pending urgent actions, and vice versa for a action-guarded process term. Moreover, it shows how urgent activated actions and urgent live events are strictly related. This statement will be used to prove Proposition 6.2 and 6.5.

Proposition 5.11 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$ and $A \subseteq \mathbb{A}_{\tau}$. Then:

1. $Q \xrightarrow{1}$ implies $\mathcal{U}(Q)=\emptyset$;
2. $Q$ action-guarded and $\mathcal{U}(Q)=\emptyset$ implies $Q \xrightarrow{1}$;
3. $\mathcal{U}(Q, A)=\emptyset$ if and only if $\operatorname{UE}(Q, A)=\emptyset$.

The following proposition states that process terms that are able to perform two subsequent time steps cannot exhibit any functional behaviour. Moreover, if a term cannot make any functional move (and is action-guarded), then it can let two time steps pass. Intuitively, this captures the functional deadlock of terms. Terms that cannot exhibit any functional behaviour can let any amount of time pass. The following proposition formalises this intuition. It will be used to prove Proposition 6.6.

Proposition 5.12 Let $Q, Q^{\prime}, Q^{\prime \prime} \in \mathrm{L}(\tilde{\mathbb{P}})$.

1. $Q \xrightarrow{1} Q^{\prime} \xrightarrow{1} Q^{\prime \prime}$ implies $Q \xrightarrow{q}$ and $Q^{\prime} \xrightarrow{q}$ for any $\alpha \in \mathbb{A}_{\tau}$. Moreover $Q^{\prime}=Q^{\prime \prime}$;
2. $Q$ action-guarded and $Q \xrightarrow{q}$ for any $\alpha \in \mathbb{A}_{\tau}$ implies $Q \xrightarrow{1} Q^{\prime} \xrightarrow{1} Q^{\prime}$

### 5.3 Fair execution sequences

We can now define the (weak) fairness constraint. The following definitions and results are essentially borrowed from [9], and just adapted to our notions of fairness and labelling. First of all, for a process $Q_{0}$, we say that a sequence of transitions $\gamma=Q_{0} \xrightarrow{\lambda_{0}} Q_{1} \xrightarrow{\lambda_{1}} \ldots$ with $\lambda_{i} \in \mathbb{A}_{\tau} \cup\{1\}$ is a timed execution sequence if it is an infinite sequence of action transitions and full time-steps; note that a maximal sequence of such transitions/steps is never finite, since for $\gamma=Q_{0} \xrightarrow{\lambda_{0}} Q_{1} \xrightarrow{\lambda_{1}} \ldots \xrightarrow{\lambda_{n-1}} Q_{n}$, we have either $Q_{n} \xrightarrow{\alpha}$ or $Q_{n} \xrightarrow{1}$ by Proposition 5.12.2. The second part of this proposition is applicable, since processes are always action-guarded. Note that a timed execution sequence is everlasting
in the sense of having infinitely many time steps if and only if it is non-Zeno; a Zeno run would have infinitely many actions in a finite amount of time, which in a setting with discrete time means exactly that it ends with infinitely many action transitions without a time step.

For an initial process $P_{0}$, we say that a sequence of transitions $\gamma=P_{0} \xrightarrow{\alpha_{0}} P_{1} \xrightarrow{\alpha_{1}} \ldots$ with $\alpha_{i} \in \mathbb{A}_{\tau}$ is an execution sequence if it is a maximal sequence of action transitions; i.e. it is infinite or ends with a process $P_{n}$ such that $P_{n} \nrightarrow$ for any action $\alpha$. Now we formalise fairness by calling a (timed) execution sequence fair, if no event becomes live and then remains live throughout.

Definition 5.13 (fair execution sequences) Let $\gamma=Q_{0} \xrightarrow{\lambda_{0}} Q_{1} \xrightarrow{\lambda_{1}} \ldots$ be an execution sequence or a timed execution sequence from $Q_{0}$; we will write '(timed) execution sequence' for such a sequence. We say that $\gamma$ is fair if

$$
\neg\left(\exists s \exists i . \forall k \geq i: s \in \operatorname{LE}\left(Q_{k}\right)\right)
$$

Following [9], now we present an alternative, more local, definition of fair computations which will be useful to prove our main statements.

Definition 5.14 (B-step) For a process $Q_{0}$, we say that $Q_{0} \xrightarrow{\lambda_{0}} Q_{1} \xrightarrow{\lambda_{1}} \ldots \xrightarrow{\lambda_{n-1}} Q_{n}$ with $n>0$ is a timed $B$-step when (i) $B$ is a finite set of event labels, and (ii) $B \cap \operatorname{LE}\left(Q_{0}\right) \cap \ldots \cap \operatorname{LE}\left(Q_{n}\right)=\emptyset$. If $\lambda_{i} \in \mathbb{A}_{\tau}, i=0, \ldots, n-1$, then the sequence is a $B$-step. If $Q_{0} \xrightarrow{\lambda_{0}} Q_{1} \xrightarrow{\lambda_{1}} \ldots \xrightarrow{\lambda_{n-1}} Q_{n}$ is a (timed) $B$-step and $v=\lambda_{0} \ldots \lambda_{n-1}$ we write $Q_{0}{ }^{v}{ }_{B} Q_{n+1}$.

In particular, a (timed) $\operatorname{LE}(Q)$-step from $Q$ is "locally" fair: all live events of $Q$ lose their liveness at some point in the step.

Definition 5.15 (fair-step sequences) A (timed) fair-step sequence from $Q_{0}$ is any maximal sequence of (timed) steps of the form $Q_{0} \xrightarrow{v_{0}} \operatorname{LE}\left(Q_{0}\right) Q_{1} \xrightarrow{v_{1}} \operatorname{LE}\left(Q_{1}\right) \cdots$

A fair-step sequence is simply a concatenation of locally fair steps. If $\delta$ is a (timed) fair-step sequence, then its associated (timed) execution sequence is the sequence which drops all references to the sets $\operatorname{LE}\left(Q_{i}\right)$.

Corollary 5.16 A (timed) execution sequence is fair if and only if it is the sequence associated with a (timed) fair-step sequence.

## 6 Fairness and Timing

This section relates fairness and timing in a process algebraic setting. It contains two main contributions. First, we prove that all everlasting (i.e. non-Zeno) sequences of PAFAS ${ }_{r}$ processes are fair. Second, we provide a characterisation of fair execution sequences of initial $\mathrm{PAFAS}_{r}$ processes (PAFAS ${ }_{r}$ processes evolving only via functional operational semantics) in terms of timed execution sequences. For finite state processes, one can derive from this a finite representation of the fair runs with a transition system that has arcs labelled by regular expressions, as done in [4].

### 6.1 Fairness of everlasting sequences

The next two propositions are key statements for proving that everlasting timed execution sequences of PAFAS processes are fair. The former result relates time steps, urgent live events and live events; the latter one relate $\mathrm{LE}(P)$-steps ans sequences of actions between consecutive time-step.

Proposition 6.1 Let $Q$ be a labelled process term. Then: $Q \xrightarrow{X}{ }_{r} Q_{1} \xrightarrow{\alpha_{1}} \ldots \xrightarrow{\alpha_{n-1}} Q_{n}$, where $X \subseteq \mathbb{A}$ and $\alpha_{1}, \ldots, \alpha_{n-1} \in \mathbb{A}_{\tau}$, implies $\operatorname{LE}\left(Q_{1}\right) \cap\left(\operatorname{LE}\left(Q_{n}\right) \backslash \operatorname{UE}\left(Q_{n}\right)\right)=\emptyset$ (and by Proposition 5.10 also $\left.\operatorname{LE}(Q) \cap\left(\operatorname{LE}\left(Q_{n}\right) \backslash \operatorname{UE}\left(Q_{n}\right)\right)=\emptyset\right)$.

Proof: Assume, toward a contradiction, that there exists a tuple of labels $s=\left\langle v_{1}, \ldots, v_{m}\right\rangle$ such that $s \in \operatorname{LE}\left(Q_{1}\right)=\operatorname{UE}\left(Q_{1}\right)$ (by Proposition 5.10-2) and $s \in \operatorname{LE}\left(Q_{n}\right) \backslash \mathrm{UE}\left(Q_{n}\right)$. Lemma 5.9-2 and $s \in \operatorname{LE}\left(Q_{1}\right)$ imply $v_{1}, \ldots, v_{m} \in \operatorname{LAB}\left(Q_{1}\right)$. On the other hand, since $s \in \operatorname{UE}\left(Q_{1}\right)$ but $s \notin \operatorname{UE}\left(Q_{n}\right)$, we can find $j, 1 \leq j<n$, such that $s \in \mathrm{UE}\left(Q_{j}\right)$ and $s \notin \mathrm{UE}\left(Q_{j+1}\right)$. Then, by Proposition 5.10-1, there exists some $k \in[1, m]$ such that $v_{k} \notin \mathrm{LAB}\left(Q_{j+1}\right)$. By Fact 5.6, $v_{k} \in \mathrm{LAB}\left(Q_{1}\right)$ and $v_{k} \notin \mathrm{LAB}\left(Q_{j+1}\right)$ implies $v_{k} \notin \operatorname{LAB}\left(Q_{i}\right)$, for every $i \in[j+1, n]$ and, again by Lemma 5.9 , $s \notin \operatorname{LE}\left(Q_{i}\right)$, for every $i \in[j+1, n]$. In particular, $s \notin \operatorname{LE}\left(Q_{n}\right)$ which contradicts the assumption $s \in \operatorname{LE}\left(Q_{n}\right) \backslash \operatorname{UE}\left(Q_{n}\right)$.

Proposition 6.2 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$ and $v, w \in\left(\mathbb{A}_{\tau}\right)^{*}$.

1. If $Q \xrightarrow{1} Q_{1} \xrightarrow{v} Q_{2} \xrightarrow{1}$ then $Q \xrightarrow{1 v} \operatorname{LE}(Q) Q_{2}$;
2. If $Q \xrightarrow{v} Q^{\prime} \xrightarrow{1} Q_{1}^{\prime} \xrightarrow{w} Q_{2}^{\prime} \xrightarrow{1}$ then $Q \xrightarrow{v 1 w} \operatorname{LE}(Q) Q_{2}^{\prime}$.

Proof: Item 2 follows immediately from 1. and the definition of a timed $B$-step. We only prove Item 1. Assume that $Q \xrightarrow{1} Q_{1} \xrightarrow{v} Q_{2}$. Proposition 6.1 implies $\operatorname{LE}(Q) \cap\left(\operatorname{LE}\left(Q_{2}\right) \backslash \operatorname{UE}\left(Q_{2}\right)\right)=\emptyset$. Moreover $Q_{2} \xrightarrow{1}$ and Proposition 5.11 imply that $\mathcal{U}\left(Q_{2}\right)=\emptyset$ and $\operatorname{UE}\left(Q_{2}\right)=\emptyset$. Thus $\operatorname{LE}(Q) \cap$ $\operatorname{LE}\left(Q_{1}\right) \cap \ldots \cap \operatorname{LE}\left(Q_{2}\right) \subseteq \operatorname{LE}(Q) \cap \operatorname{LE}\left(Q_{2}\right)=\operatorname{LE}(Q) \cap\left(\operatorname{LE}\left(Q_{2}\right) \backslash \operatorname{UE}\left(Q_{2}\right)\right)=\emptyset$. By the definition of a timed $B$-step, $Q \xrightarrow{1 v} \operatorname{LE}(P) Q_{2}$.

Theorem 6.3 Let $v_{0}, v_{1}, v_{2} \ldots \in\left(\mathbb{A}_{\tau}\right)^{*}$. Each everlasting timed execution sequence, i.e. each timed execution sequence of the form $\gamma=P_{0} \xrightarrow{v_{0}} P_{1} \xrightarrow{1} Q_{1} \xrightarrow{v_{1}} P_{2} \xrightarrow{1} Q_{2} \xrightarrow{v_{2}} P_{3} \xrightarrow{1} \ldots$ is fair.

Proof: By Proposition 6.2 we have that $P_{0} \xrightarrow{v_{0} 1 v_{1}} \operatorname{LE}\left(P_{0}\right) P_{2}, P_{2} \xrightarrow{1 v_{2}} \operatorname{LE}\left(P_{2}\right) P_{3}$ and so on. Then $\gamma$ is a sequence associated with a timed fair-step sequence and is fair by Corollary 5.16.

Observe that an everlasting timed execution sequence, by its definition, does not depend on the labelling, i.e. it is a notion of the unlabelled PAFAS calculus.

### 6.2 Relating Timed Executions and Fair Executions

While in the previous section we have shown that every everlasting timed execution is fair, here we show that everlasting timed execution sequences of initial PAFAS processes in fact characterise the fair untimed executions of these processes. Observe that the latter is a notion of a labelled untimed process algebra (like CCS or TCSP), while the former is a notion of our unlabelled timed process algebra. The key statement for proving this relates B-steps and action sequences performed between two full time-steps. In more detail, we prove that whenever an initial process $P$ can perform a sequence $v$ of basic actions and this execution turns out to be an LE $(P)$-step, then $P$ can alternatively let time pass (perform a 1 -time step) and then perform the sequence of basic actions $v$, and vice versa. The following proposition relates live events and transitional properties of terms in $\tilde{\mathbb{P}}_{1}$ and their "marked" version. The proof and related results have been moved to Appendix G.

Proposition 6.4 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$ and $P \in \mathrm{~L}\left(\tilde{\mathbb{P}}_{1}\right)$ such that $P=\operatorname{unmark}(Q)$. Then:

1. $\mathrm{LE}(Q, A)=\mathrm{LE}(P, A)$ for every $\mathrm{A} ;$
2. $Q \xrightarrow{\alpha} Q^{\prime}$ implies $P \xrightarrow{\alpha} P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$ for some $P^{\prime}$. Moreover $\operatorname{UE}\left(Q^{\prime}, A\right) \subseteq \operatorname{UE}(Q, A)$ and, whenever $Q^{\prime}$ is clean and $\operatorname{UE}\left(Q^{\prime}\right)=\emptyset$, we have $Q^{\prime}=P^{\prime}$;
3. $P \xrightarrow{\alpha} P^{\prime}$ implies $Q \xrightarrow{\alpha} Q^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$ for some $Q^{\prime}$.

Now we are ready to present our key proposition relating LE-step and temporal transitions.
Proposition 6.5 Let $P_{0} \in \mathrm{~L}\left(\mathbb{P}_{1}\right)$ and $v=\alpha_{1} \ldots \alpha_{n} \in\left(\mathbb{A}_{\tau}\right)^{+}$. Then:

1. $P_{0} \xrightarrow{v} \mathrm{LE}\left(P_{0}\right) P_{n}$ implies $P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v} P_{n}$;
2. $P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v} Q_{n} \xrightarrow{1}$ implies $Q_{n}=P_{n} \in \mathrm{~L}\left(\mathbb{P}_{1}\right)$ and $P_{0} \xrightarrow{v} \mathrm{LE}\left(P_{0}\right) P_{n}$.

Proof: Let us first prove Item 1. $P_{0} \xrightarrow{v} \mathrm{LE}\left(P_{0}\right) P_{n}$ implies $P_{0} \xrightarrow{v} P_{n}$ and $\operatorname{LE}\left(P_{0}\right) \cap \ldots \cap \operatorname{LE}\left(P_{n}\right)=\emptyset$. Since $P_{0} \in \mathrm{~L}\left(\mathbb{P}_{1}\right)$, it is $P_{0} \xrightarrow{1} Q_{0}$ with $P_{0}=\operatorname{unmark}\left(Q_{0}\right)$ (easy induction proof) and, by Proposition 6.4-3 and 6.4-1, $Q_{0} \xrightarrow{\alpha_{0}} \ldots \xrightarrow{\alpha_{n}} Q_{n}$ with $P_{i}=\operatorname{unmark}\left(Q_{i}\right)$ and $\operatorname{LE}\left(P_{i}\right)=\operatorname{LE}\left(Q_{i}\right)$ for every $i \in[0, n]$. Then $\operatorname{LE}\left(Q_{0}\right) \cap \ldots \cap \operatorname{LE}\left(Q_{n}\right)=\emptyset$ and, since $\operatorname{UE}(S) \subseteq \operatorname{LE}(S)$ for a generic $S$ (Lemma 5.9), also $\mathrm{UE}\left(Q_{0}\right) \cap \ldots \cap \mathrm{UE}\left(Q_{n}\right)=\emptyset$. Moreover, by Proposition 6.4-2, $\mathrm{UE}\left(Q_{i+1}\right) \subseteq \mathrm{UE}\left(Q_{i}\right)$ for $i \in[0, n-1]$. Thus UE $\left(Q_{n}\right)=\emptyset, Q_{n}$ clean (by Proposition 2.10) and Proposition 6.4-2 imply $Q_{n}=P_{n}$. We get $P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v} P_{n}$.

Now, assume $P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v} Q_{n} \xrightarrow{1}$. By Proposition 6.1 it is $\operatorname{LE}\left(Q_{0}\right) \cap\left(\operatorname{LE}\left(Q_{n}\right) \backslash \operatorname{UE}\left(Q_{n}\right)\right)=\emptyset$. Moreover $Q_{n} \xrightarrow{1}$ and Propositions 5.11-1 and 5.11-3 imply $\operatorname{UE}\left(Q_{n}\right)=\emptyset$ and, hence, $\operatorname{LE}\left(Q_{0}\right) \cap$ $\operatorname{LE}\left(Q_{n}\right)=\emptyset=\operatorname{LE}\left(Q_{0}\right) \cap \ldots \cap \operatorname{LE}\left(Q_{n}\right)$. Now, $P_{0}=$ unmark $\left(Q_{0}\right)$ (as above) Propositions 6.4-2 and 6.4-1 implies $P_{0} \xrightarrow{\alpha_{0}} \ldots \xrightarrow{\alpha_{n}} P_{n}$ with $P_{i}=\operatorname{unmark}\left(Q_{i}\right), \operatorname{LE}\left(P_{i}\right)=\operatorname{LE}\left(Q_{i}\right)$ for every $i \in[0, n]$. Again by Propositions 2.10 and 6.4-2, we also have $Q_{n}=P_{n}$. Thus, by definition, $P_{0} \xrightarrow{v} \operatorname{LE}\left(P_{0}\right) P_{n}$.

Iterative applications of Proposition 6.5 prove the main theorems of this section. To present our characterisation results we distinguish between finite and infinite sequences of untimed processes.

Proposition 6.6 Let $P \in \mathrm{~L}\left(\mathbb{P}_{1}\right)$ and $v_{0}, v_{1}, \ldots \in\left(\mathbb{A}_{\tau}\right)^{+}$. Then:

1. For any finite fair-step sequence from $P$

$$
P=P_{0} \xrightarrow{v_{0}} \mathrm{LE}\left(P_{0}\right) P_{1} \xrightarrow{v_{1}} \mathrm{LE}\left(P_{1}\right) P_{2} \ldots P_{n-1} \xrightarrow{v_{n-1}} \mathrm{LE}\left(P_{n-1}\right) P_{n}
$$

there exists a timed execution sequence

$$
P=P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v_{0}} P_{1} \xrightarrow{1} Q_{1} \xrightarrow{v_{1}} P_{2} \ldots P_{n-1} \xrightarrow{1} Q_{n-1} \xrightarrow{v_{n-1}} P_{n} \xrightarrow{1} Q_{n} \xrightarrow{1} Q_{n} \ldots
$$

2. For any timed execution sequence

$$
P=P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v_{0}} P_{1} \xrightarrow{1} Q_{1} \xrightarrow{v_{1}} P_{2} \ldots P_{n-1} \xrightarrow{1} Q_{n-1} \xrightarrow{v_{n-1}} P_{n} \xrightarrow{1} Q_{n} \xrightarrow{1} Q_{n} \ldots
$$

there exists a finite fair-step sequence from $P$

$$
P_{0} \xrightarrow{v_{0}} \mathrm{LE}\left(P_{0}\right) P_{1} \xrightarrow{v_{1}} \mathrm{LE}\left(P_{1}\right) P_{2} \ldots P_{n-1} \xrightarrow{v_{n-1}} \mathrm{LE}\left(P_{n-1}\right) P_{n}
$$

Proof: First we prove Item 1. Assume $P_{0} \xrightarrow{v_{0}} \operatorname{LE}\left(P_{0}\right) P_{1} \xrightarrow{v_{1}} \operatorname{LE}\left(P_{1}\right) P_{2} \ldots P_{n-1} \xrightarrow{v_{n-1}} \operatorname{LE}\left(P_{n-1}\right) P_{n}$ and $P_{n} \xrightarrow{q}$ for any $\alpha$. By iterative applications of Proposition $6.5-1$ we can prove that $P_{i} \xrightarrow{1} Q_{i} \xrightarrow{v_{i}} P_{i+1}$ for $i \in[0, n-1]$. Moreover $P_{n} \in \mathrm{~L}\left(\mathbb{P}_{1}\right)$ (and hence $P_{n}$ action-guarded) and $P_{n} \xrightarrow{q}$ for any $\alpha \in \mathbb{A}_{\tau}$ imply, by Proposition 5.12-2, $P_{n} \xrightarrow{1} Q_{n} \xrightarrow{1} Q_{n}$. Now, we prove Item $2 . \quad P=P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v_{0}}$ $P_{1} \xrightarrow{1} Q_{1} \xrightarrow{v_{1}} P_{2} \ldots P_{n-1} \xrightarrow{1} Q_{n-1} \xrightarrow{v_{n-1}} P_{n} \xrightarrow{1} Q_{n} \xrightarrow{1} Q_{n} \ldots$ Then, by iterative applications of Proposition 6.5-2, we can prove that $P=P_{0} \xrightarrow{v_{0}} \mathrm{LE}\left(P_{0}\right) P_{1} \xrightarrow{v_{1}} \mathrm{LE}\left(P_{1}\right) P_{2} \ldots P_{n-1} \xrightarrow{v_{n-1}} \operatorname{LE}\left(P_{n-1}\right) P_{n}$. Moreover $P_{n} \xrightarrow{1} Q_{n} \xrightarrow{1} Q_{n}$ and Proposition 5.12-1 imply $P_{n} \xrightarrow{q}$ for any $\alpha \in \mathbb{A}_{\tau}$.

Similarly we can prove an analogous result for infinite sequences.
Proposition 6.7 Let $P \in \mathrm{~L}\left(\mathbb{P}_{1}\right)$ and $v_{0}, v_{1}, \ldots \in\left(\mathbb{A}_{\tau}\right)^{+}$. Then:

1. For any infinite fair-step sequence from $P$

$$
P=P_{0} \xrightarrow{v_{0}} \operatorname{LE}\left(P_{0}\right) P_{1} \xrightarrow{v_{1}} \operatorname{LE}\left(P_{1}\right) P_{2} \ldots P_{i} \xrightarrow{v_{i}} \operatorname{LE}\left(P_{i}\right) P_{i+1} \ldots
$$

there exists a timed execution sequence

$$
P=P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v_{0}} P_{1} \xrightarrow{1} Q_{1} \xrightarrow{v_{1}} P_{2} \ldots P_{i} \xrightarrow{1} Q_{i} \xrightarrow{v_{i}} P_{i+1} \ldots
$$

2. For any timed execution sequence

$$
P=P_{0} \xrightarrow{1} Q_{0} \xrightarrow{v_{0}} P_{1} \xrightarrow{1} Q_{1} \xrightarrow{v_{1}} P_{2} \ldots P_{i} \xrightarrow{1} Q_{i} \xrightarrow{v_{i}} P_{i+1} \ldots
$$

there exists a finite fair-step sequence from $P$

$$
P=P_{0} \xrightarrow{v_{0}} \mathrm{LE}\left(P_{0}\right) P_{1} \xrightarrow{v_{1}} \mathrm{LE}\left(P_{1}\right) P_{2} \ldots P_{i} \xrightarrow{v_{i}} \mathrm{LE}\left(P_{i}\right) P_{i+1} \ldots
$$

By Proposition 5.3 we can also remove the labels from processes $P_{i}, Q_{i}$ in the timed computation, and by Corollary 5.16 we can replace fair-step sequences by fair execution sequences. This way, we obtain a similar correspondence result between fair executions of labelled $\mathrm{PAFAS}_{r}$ and timed executions of unlabelled $\mathrm{PAFAS}_{r}$.

Theorem 6.8 (Characterisation of finite fair timed execution sequences)
Let $P \in \mathrm{~L}\left(\mathbb{P}_{1}\right)$ and $\alpha_{0}, \alpha_{1}, \alpha_{2} \ldots \in \mathbb{A}_{\tau}$. Then:

1. For any finite fair execution sequence from $P$

$$
P=P_{0} \xrightarrow{\alpha_{0}} P_{1} \xrightarrow{\alpha_{1}} P_{2} \ldots P_{n-1} \xrightarrow{\alpha_{n-1}} P_{n}
$$

there exists a timed execution sequence in unlabelled $\mathrm{PAFAS}_{r}$

$$
\mathrm{R}(P)=R_{i_{0}} \xrightarrow{1} Q_{i_{0}} \xrightarrow{v_{i_{0}}} R_{i_{1}} \xrightarrow{1} Q_{i_{1}} \xrightarrow{v_{i_{1}}} R_{i_{2}} \ldots R_{i_{m}} \xrightarrow{1} Q_{i_{m}} \xrightarrow{1} Q_{i_{m}} \xrightarrow{1} \ldots
$$

where $i_{0}, i_{1}, \ldots, i_{m-1}, i_{m} \in[0, n]$ with $i_{0}=0$ and $i_{m}=n, v_{i_{j}}=\alpha_{i_{j}} \alpha_{i_{j}+1} \ldots \alpha_{i_{j+1}-1}$, and $R_{i_{j}}=\mathrm{R}\left(P_{i_{j}}\right)$, for every $j \in[0, m]$.
2. For any timed execution sequence from $\mathrm{R}(P)$ in unlabelled PAFAS $_{r}$

$$
\mathrm{R}(P)=R_{i_{0}} \xrightarrow{1} Q_{i_{0}} \xrightarrow{v_{i_{0}}} R_{i_{1}} \xrightarrow{1} Q_{i_{1}} \xrightarrow{v_{i_{1}}} R_{i_{2}} \ldots R_{i_{m}} \xrightarrow{1} Q_{i_{m}} \xrightarrow{1} Q_{i_{m}} \xrightarrow{1} \ldots
$$

where $i_{0}=0, v_{i_{j}}=\alpha_{i_{j}} \alpha_{i_{j}+1} \ldots \alpha_{i_{j+1}-1}$, for every $j \in[0, m]$, there exists a finite fair execution sequence

$$
P=P_{0} \xrightarrow{\alpha_{0}} P_{1} \xrightarrow{\alpha_{1}} P_{2} \ldots P_{n-1} \xrightarrow{\alpha_{n-1}} P_{n}
$$

where $i_{m}=n$ and $R_{i_{j}}=\mathrm{R}\left(P_{i_{j}}\right)$, for every $j \in[0, m]$.
Theorem 6.9 (Characterisation of infinite fair timed execution sequences)
Let $P \in \mathrm{~L}\left(\mathbb{P}_{1}\right)$ and $\alpha_{0}, \alpha_{1}, \alpha_{2} \ldots \in \mathbb{A}_{\tau}$. Then:

1. For any infinite fair execution sequence from $P$

$$
P=P_{0} \xrightarrow{\alpha_{0}} P_{1} \xrightarrow{\alpha_{1}} P_{2} \ldots P_{i} \xrightarrow{\alpha_{i}} P_{i+1} \ldots
$$

there exists a timed execution sequence in unlabelled PAFAS $_{r}$

$$
\mathrm{R}(P)=R_{i_{0}} \xrightarrow{1} Q_{i_{0}} \xrightarrow{v_{i_{0}}} R_{i_{1}} \xrightarrow{1} Q_{i_{1}} \xrightarrow{v_{i_{1}}} R_{i_{2}} \ldots R_{i_{j}} \xrightarrow{1} Q_{i_{j}} \xrightarrow{v_{i_{j}}} R_{i_{j+1}} \ldots
$$

where $i_{0}=0, v_{i_{j}}=\alpha_{i_{j}} \alpha_{i_{j}+1} \ldots \alpha_{i_{j+1}-1}$ and $R_{i_{j}}=\mathrm{R}\left(P_{i_{j}}\right)$, for every $j \geq 0$.
2. For any timed execution sequence from $\mathrm{R}(P)$ in unlabelled PAFAS $_{r}$

$$
\mathrm{R}(P)=R_{i_{0}} \xrightarrow{1} Q_{i_{0}} \xrightarrow{v_{i_{0}}} Q_{i_{1}} \xrightarrow{1} R_{i_{1}} \xrightarrow{v_{i_{1}}} R_{i_{2}} \ldots R_{i_{j}} \xrightarrow{1} Q_{i_{j}} \xrightarrow{v_{i_{j}}} R_{i_{j+1}} \ldots
$$

where $i_{0}=0, v_{i_{j}}=\alpha_{i_{j}} \alpha_{i_{j}+1} \ldots \alpha_{i_{j+1}-1}$, for every $j \geq 0$, there exists an infinite fair execution sequence

$$
P=P_{0} \xrightarrow{\alpha_{0}} P_{1} \xrightarrow{\alpha_{1}} P_{2} \ldots P_{i} \xrightarrow{\alpha_{i}} P_{i+1} \ldots
$$

where $R_{i_{j}}=\mathrm{R}\left(P_{i_{j}}\right)$, for every $j \geq 0$.
Example 6.10 Consider again $P=\left(R \|_{\emptyset} W\right) \|_{\{r, w\}} V$ from Example 2.8 and a run from $P$ consisting of infinitely many $r$ 's. Such a run is fair w.r.t. actions; in particular, it is fair for $w$ because, at each transition, process $V$ offers a "fresh" action $w$ for synchronisation - each time an action $r$ is performed, a new instance of $w$ is produced. We can use timing to see this fairness formally. After a time step, all activated actions become urgent and must be performed or get disabled before the next time step; this happens when $r$ is performed, as we noted above: $P \xrightarrow{1}\left((\operatorname{rec} x . \underline{r} . x) \|_{\emptyset}(\operatorname{rec} x . \underline{w} \cdot x)\right) \|_{\{r, w\}}$ rec $x .(\underline{r} . x+\underline{w} \cdot x) \xrightarrow{r} P$. If we repeat this infinitely often, we get a non-Zeno timed execution sequence related to the trace of infinitely many $r$ 's. Thus, fairness of actions allows computations along which repeated reading of a variable indefinitely blocks another process trying to write to it (and vice versa for repeated writing).

As stated in [6] this is the reason why some fair runs of Dekker's algorithm violate liveness (see below) when using standard PAFAS. Note that this problem is not specific to our setting or to our notion of fairness. In [17], Raynal writes about Dekker that possibly, "if $P_{i}$ is a very fast repetitive process which ... keeps entering its critical section, ... $P_{j}$ cannot set flag $[j]$ to true, being prevented from doing so by $P_{i}$ 's reading of the variable." He observes that liveness of the algorithm therefore depends on the liveness of the hardware. This is exactly the sort of consideration for which we have
a formal treatment: read prefixes say that the hardware guarantees that at least infinite reading cannot block writing.

In the case of our example, we can prevent this kind of unwanted behaviour by modelling the action $r$ as reading (see Example 2.8). Indeed, a run from $P^{\prime}=\left(R \|_{\emptyset} W\right) \|_{\{r, w\}} V^{\prime}$ consisting of infinitely many $r$ is not fair, since we can have at most one time step along such a run: e.g. $P^{\prime} \xrightarrow{1}\left(\underline{R} \|_{\emptyset} \underline{W}\right) \|_{\{r, w\}} \underline{V}^{\prime}=Q \xrightarrow{r} Q^{\prime} \xrightarrow{r} \ldots \xrightarrow{r} Q^{\prime} \ldots$, where $Q^{\prime}$ does not allow a full time step. Now, fairness of actions ensures that a process trying to write the variable will eventually do so. Notice that, on the contrary, a run from $P^{\prime}$ consisting of infinitely many $w$ only is still fair (again by Example 2.8, $P^{\prime} \xrightarrow{1} Q \xrightarrow{w} P^{\prime}$ ) and, hence, repeated writing of a variable can block another process trying to read it. We can prevent also this kind of behaviour if the process variable is represented as $V^{\prime \prime}=r \triangleright(w \triangleright$ nil), which only makes sense if writing does not change the system state.

## 7 Fairness and PAFAS ${ }_{s}$

In this section we briefly consider the problem of defining and characterizing fair computations of read-proper $\tilde{\mathbb{S}}$-terms. Due to our expressiveness result (Theorem 4.3) and due to the correspondence between the timed behaviour of a labelled term $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$ and its unlabelled version (see Proposition 5.3 ), fair execution sequences in the case of read-proper terms in $\tilde{\mathbb{S}}$ can be defined as follows.

Definition 7.1 (fair execution sequences) Let $Q_{0} \in \tilde{\mathbb{S}}$ be read-proper. We say that a (timed) execution sequence $\gamma=Q_{0} \xrightarrow{\lambda_{0}} Q_{1} \xrightarrow{\lambda_{1}} \ldots$ (in unlabelled $\mathrm{PAFAS}_{s}$ ) is fair if the (timed) execution sequence $\gamma^{\prime}=Q_{0}^{\prime} \xrightarrow{\lambda_{0}} Q_{1}^{\prime} \xrightarrow{\lambda_{1}} \ldots$ (in the labelled $\left.\mathrm{PAFAS}_{r}\right)$ is where $Q_{i}^{\prime} \in \mathrm{L}\left(\llbracket Q_{i} \rrbracket\right)$ for each $i \geq 0$.

Again by Theorem 4.3 and Proposition 5.3, we can state the following theorem, providing a characterisation of fair execution sequences of initial read-proper PAFAS $_{s}$ processes in terms of timed execution sequences, as a trivial consequence of Theorems 6.8 and 6.9.

Theorem 7.2 (Characterisation of fair timed execution sequences for $P A F A S_{s}$ processes)
Let $S \in \mathbb{S}_{1}$ be read-proper and $\alpha_{0}, \alpha_{1}, \alpha_{2} \ldots \in \mathbb{A}_{\tau}$. Then:

1. Any finite execution sequence from $S$

$$
S=S_{0} \xrightarrow{\alpha_{0}} S_{1} \xrightarrow{\alpha_{1}} S_{2} \ldots S_{n-1} \xrightarrow{\alpha_{n-1}} S_{n}
$$

is fair iff there exists a timed execution sequence

$$
R_{i_{0}} \xrightarrow{1} Q_{i_{0}} \xrightarrow{v_{i_{0}}} R_{i_{1}} \xrightarrow{1} Q_{i_{1}} \xrightarrow{v_{i_{1}}} R_{i_{2}} \ldots R_{i_{m}} \xrightarrow{1} Q_{i_{m}} \xrightarrow{1} Q_{i_{m}} \xrightarrow{1} \ldots
$$

where $i_{0}, i_{1}, \ldots, i_{m-1}, i_{m} \in[0, n]$ with $i_{0}=0$ and $i_{m}=n, v_{i_{j}}=\alpha_{i_{j}} \alpha_{i_{j}+1} \ldots \alpha_{i_{j+1}-1}$, and $R_{i_{j}}=S_{i_{j}}$, for every $j \in[0, m]$.
2. Any infinite fair execution sequence from $S$

$$
S=S_{0} \xrightarrow{\alpha_{0}} S_{1} \xrightarrow{\alpha_{1}} S_{2} \ldots S_{i} \xrightarrow{\alpha_{i}} S_{i+1} \ldots
$$

is fair iff there exists a timed execution sequence

$$
R_{i_{0}} \xrightarrow{1} Q_{i_{0}} \xrightarrow{v_{i_{0}}} R_{i_{1}} \xrightarrow{1} Q_{i_{1}} \xrightarrow{v_{i_{1}}} R_{i_{2}} \ldots R_{i_{j}} \xrightarrow{1} Q_{i_{j}} \xrightarrow{v_{i_{j}}} R_{i_{j+1}} \ldots
$$

where $i_{0}=0, v_{i_{j}}=\alpha_{i_{j}} \alpha_{i_{j}+1} \ldots \alpha_{i_{j+1}-1}$ and $R_{i_{j}}=S_{i_{j}}$, for every $j \geq 0$.

## 8 Dekker's algorithm and its liveness property

In this section we briefly describe Dekker's MUTEX algorithm. There are two processes $P_{1}$ and $P_{2}$, two Boolean-valued variables $b_{1}$ and $b_{2}$, whose initial values are false, and a variable $k$, which may take the values 1 and 2 and whose initial value is arbitrary. Informally, the $b$ variables are "request" variables and $k$ is a "turn" variable: $b_{i}$ is true if $\mathrm{P}_{i}$ is requesting entry to its critical section and $k$ is $i$ if it is $\mathrm{P}_{i}$ 's turn to enter its critical section. Only $\mathrm{P}_{i}$ writes $b_{i}$, but both processes read it. The $i$ th process (with $i=1,2$ ) can be described as follows, where $j$ is the index of the other process:

```
while true do begin
    <noncritical section\rangle;
    bi}=\mathrm{ true;
    while }\mp@subsup{b}{j}{}\mathrm{ do if }k=j\mathrm{ then begin
            bi}:=\mathrm{ false; while k=j do skip; b
    end;
    <critical section\rangle;
    k:=j; b
end;
```

### 8.1 Translating the Algorithm into PAFAS ${ }_{s}$ Processes

In our translation of the algorithm into $\mathrm{PAFAS}_{s}$, we use essentially the same coding as Walker in [20]. Each program variable is represented as a family of processes. For instance, the process $\mathrm{B}_{1}(f a l s e)$ denotes the variable $b_{1}$ with value false. The sort of the process $\mathrm{B}_{1}(f a l s e)$ (i.e. the set of actions it can ever perform) is the set $\left\{b_{1} r f, b_{1} r t, b_{1} w f, b_{1} w t\right\}$ where $b_{1} r f$ and $b_{1} r t$ represent the actions of reading the values false and true from $b_{1}, b_{1} w f$ and $b_{1} w t$ represent, respectively, the writing of the values false and true into $b_{1}$. Let $\mathbb{B}=\{$ false, true $\}$ and $\mathbb{K}=\{1,2\}$.

Definition 8.1 (the algorithm) Let $i \in\{1,2\}$. We define the processes representing program variables as follows:

$$
\begin{array}{ll}
\mathrm{B}_{i}(\text { false }) & =\left\{b_{i} r f, b_{i} w f\right\} \triangleright b_{i} w t . \mathrm{B}_{i}(\text { true }) \\
\mathrm{B}_{i}(\text { true }) & =\left\{b_{i} r t, b_{i} w t\right\} \triangleright b_{i} w f . \mathrm{B}_{i}(\text { false }) \\
\mathrm{K}(1) & =\{k r 1, k w 1\} \triangleright k w 2 . \mathrm{K}(2) \\
\mathrm{K}(2) & =\{k r 2, k w 2\} \triangleright k w 1 . \mathrm{K}(1)
\end{array}
$$

Let $B=\left\{b_{i} r f, b_{i} r t, b_{i} w f, b_{i} w t \mid i \in\{1,2\}\right\} \cup\{k r 1, k r 2, k w 1, k w 2\}$ be the union of the sorts of all variables and $\Phi_{B}$ the relabelling function such that $\Phi_{B}(\alpha)=\tau$ if $\alpha \in B$ and $\Phi_{B}(\alpha)=\alpha$ if $\alpha \notin B$. Given $b_{1}, b_{2} \in \mathbb{B}, k \in \mathbb{K}$, we define $\operatorname{PV}\left(b_{1}, b_{2}, k\right)=\left(\mathrm{B}_{1}\left(b_{1}\right) \|_{\emptyset} \mathrm{B}_{2}\left(b_{2}\right)\right) \|_{\emptyset} \mathrm{K}(k)$. Processes $\mathrm{P}_{1}$ and $\mathrm{P}_{2}$ are represented by the following PAFAS processes; the actions $\mathrm{req}_{i}$ and $\mathrm{cs}_{i}$ have been added to indicate the request to enter and the execution of the critical section by the process $P_{i}$.

$$
\begin{array}{ll}
P_{1}=\mathrm{req}_{1} \cdot b_{1} w t \cdot P_{11}+\tau \cdot P_{1} & P_{2}=\mathrm{req}_{2} \cdot b_{2} w t \cdot P_{21}+\tau \cdot P_{2} \\
P_{11}=b_{2} r f . P_{14}+b_{2} r t \cdot P_{12} & P_{21}=b_{1} r f \cdot P_{24}+b_{1} r t \cdot P_{22} \\
P_{12}=k r 1 . P_{11}+k r 2 . b_{1} w f \cdot P_{13} & P_{22}=k r \mathcal{2} \cdot P_{21}+k r 1 . b_{2} w f \cdot P_{23} \\
P_{13}=k r 1 . b_{1} w t \cdot P_{11}+k r 2 . P_{13} & P_{23}=k r 2 . b_{2} w t \cdot P_{21}+k r 1 \cdot P_{23} \\
P_{14}=\mathrm{cs}_{1} \cdot k w 2 . b_{1} w f \cdot P_{1} & P_{24}=\mathrm{cs}_{2} \cdot k w 1 \cdot b_{2} w f \cdot P_{2}
\end{array}
$$

Now, we define the algorithm as Dekker $=\left(\left(P_{1} \| P_{2}\right) \|_{B} \mathrm{PV}(\right.$ false, false, 1$\left.)\right)\left[\Phi_{B}\right]$. The sort of Dekker is the set $\mathbb{A}_{d}=\left\{\mathrm{req}_{i}, \mathrm{cs}_{i} \mid i=1,2\right\}$.

A MUTEX algorithm like Dekker's satisfies liveness if, in every fair trace, each req is followed by the respective $\mathrm{cs}_{i}$. Since no process should be forced to request by the fairness assumption, $P_{i}$ has the alternative of an internal move, i.e. staying in its noncritical section.

### 8.2 Liveness violations and catastrophic cycles

Based on PAFAS, a testing-based faster-than relation has been defined in [8] that compares processes according to their worst-case efficiency. In [7], this testing-approach is adapted to a setting where user behaviour is known to belong to a very specific, but often occurring class of requestresponse behaviours: processes serving these users receive requests via an action in and provide a response out for each in-action; it is shown how to determine an asymptotic performance measure for finite-state processes of this kind. This result only holds for request-response processes that pass certain sanity checks: they must not produce more responses than requests, and they must allow requests and provide responses in finite time. While the first requirement can easily be checked by looking at the transition system, violation of the latter requirement is characterised as the existence of so-called catastrophic cycles in a reduced transition system denoted $\mathrm{rRTS}(P)$. The refusal transition system of $P$ - denoted by RTS $(P)$ - consists of all transitions $Q \xrightarrow{\alpha} Q^{\prime}$ and $Q \xrightarrow{X}{ }_{r} Q^{\prime}$, where $Q$ is reachable from $P$ via such transitions. $\operatorname{rRTS}(P)$ is obtained by removing all time steps except those $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ where either $X=\{$ out $\}$ and $Q$ has some pending out-action or $X=\{$ in, out $\}$; then, all processes not reachable any more are deleted as well. In the case $X=\{$ out $\}$, some in has not received a response and the user is waiting for an out, but the process can still delay this, while being willing to accept another request immediately. The case $X=\{$ in, out $\}$ corresponds to a full time step). A cycle is catastrophic if it contains a time step but no in- or out-transition, such that time can pass without end without any useful actions.

A tool has been developed for automatically checking whether a process of (original) PAFAS has a catastrophic cycle with the algorithm described in [7], and only recently it has been adapted to a setting with reading actions. We will now give a result that allows us to decide whether Dekker is live using this tool. The tool cannot be applied directly: first, Dekker has more than two actions; second, it can perform a full time step followed by the two internal actions of $P_{1}$ and $P_{2}$ giving a catastrophic cycle, which is not relevant for the the liveness property.

Consequently, we modify Dekker to obtain a new process Dekker $_{i o}$ as follows: we change the actions $\mathrm{req}_{1}$ and $\mathrm{cs}_{1}$ into $\tau$ actions, we delete the $\tau$-summand of $P_{2}$ (see Definition 8.1) and, finally, we change the actions $\mathrm{req}_{2}$ and $\mathrm{cs}_{2}$ in in and out, respectively. With this, we get the following result (proven in Appendix H) and corollary:

Theorem 8.2 Dekker is live iff Dekker $_{i o}$ does not have catastrophic cycles.
Corollary 8.3 Dekker is live.

### 8.3 An alternative representation of the Dekker's algorithm

To further stress the impact of introducing non-blocking actions in PAFAS (and in general in modelling concurrent systems), in this section we show that already a slight change in our representation of Dekker's algorithm (in particular, a slightly different representation of the program variables) may have a decisive impact on the liveness property. Let Dekker $_{\ell}$ be the new version of Dekker we obtain by replacing the program variables in Definition 8.1 by the following ones.

$$
\begin{aligned}
\mathrm{B}_{i}(\text { false }) & =b_{i} r f \triangleright\left(b_{1} w f . \mathrm{B}_{1}(\text { false })+b_{1} w t . \mathrm{B}_{1}(\text { true })\right) \\
\mathrm{B}_{i}(\text { true }) & =b_{i} r t \triangleright\left(\left(b_{1} w f . \mathrm{B}_{1}(\text { false })+b_{1} w t . \mathrm{B}_{1}(\text { true })\right)\right. \\
\mathrm{K}(i) & =k r i \triangleright(k w 1 . \mathrm{K}(1)+k w 2 . \mathrm{K}(2))
\end{aligned}
$$

In this case, all write actions (even those that write the old value again) are ordinary actions. Example 8.4 shows that Dekker $_{\ell}$ is not live under the assumption of fairness of actions, i.e. there exist non-Zeno execution sequences of $D_{e k k e r}^{\ell}$ that demonstrate the violation of liveness.

Example 8.4 Consider the following sequence of steps from Dekker ${ }_{\ell}$ :

$$
\begin{aligned}
& \text { Dekker } \ell^{1} \xrightarrow{\rightarrow} Q_{0}=\left(\left(P_{1} \| P_{2}\right) \|_{B} \mathrm{PV}(\text { false, false }, 1)\right)\left[\Phi_{B}\right] \\
&\left(\left(P_{11} \| P_{21}\right) \|_{B} \mathrm{PV}(\text { true }, \text { true }, 1)\right)\left[\Phi_{B}\right] \\
&\left(\left(P_{11} \| P_{23}\right) \|_{B} \mathrm{PV}(\text { true, false }, 1)\right)\left[\Phi_{B}\right] \\
& \xrightarrow{\tau \tau \mathrm{seq}_{1} \tau} \\
& P=\left(\left(b_{1} w f . P_{1} \| P_{23}\right) \|_{B} \mathrm{PV}(\text { true }, \text { false }, 2)\right)\left[\Phi_{B}\right]
\end{aligned}
$$

Now, let $\mathrm{B}_{1}^{\prime}($ true $)=b_{1} r t \triangleright\left(\underline{b_{1} w f} . \mathrm{B}_{1}(\right.$ false $)+b_{1} w t . \mathrm{B}_{1}($ true $\left.)\right), \mathrm{K}^{\prime}(2)=\underline{k r 2} . \triangleright(k w 1 . \mathrm{K}(1)+k w 2 . \mathrm{K}(2))$ and $P_{23}^{\prime}=k r 2 . b_{2} w t . P_{21}+k r \overline{1 . P_{23}}$ (notice that we have marked as urgent the only activated actions) then:

$$
\begin{aligned}
P \xrightarrow{1} \quad Q= & \left(\left(b_{1} w f . P_{1} \| P_{23}^{\prime}\right) \|_{B}\left(\mathrm{~B}_{1}^{\prime}(\text { true }) \| \mathrm{B}_{2}(\text { false }) \| \mathrm{K}^{\prime}(2)\right)\right)\left[\Phi_{B}\right] \\
& \left(\left(\text { kw2.b} w f . b_{1} w f . P_{1} \| P_{23}^{\prime}\right) \|_{B}\left(\mathrm{~B}_{1}(\text { true }) \| \mathrm{B}_{2}(\text { false }) \| \mathrm{K}^{\prime}(2)\right)\right)\left[\Phi_{B}\right] \xrightarrow{\tau \mathrm{req}_{1} \tau \tau \mathrm{cs}_{1}} \\
& \left.\left(\left(b_{1} w f . P_{1} \| P_{23}\right) \|_{B} \mathrm{PV}(\text { true }, \text { false }, 2)\right)\right)\left[\Phi_{B}\right]
\end{aligned}
$$

As a consequence of the execution of the last internal action (i.e. after the rewriting of the value 2 to the variable $k, \mathrm{~K}^{\prime}(2)$ evolves into $\mathrm{K}(2)$ offering a new, non-urgent occurrence of the action $k r 2$ to its synchronisation partners. This causes the unmarking of the (at this stage inactive) urgency in $P_{23}^{\prime}$. Thus, the execution sequence Dekker $_{\ell} \xrightarrow{\mathrm{req}_{1} \tau \mathrm{req}_{2} \tau^{5} \mathrm{cs}_{1} \tau} P_{1} \xrightarrow{\tau \mathrm{req}_{1} \tau^{2} \mathrm{cs}_{1} \tau} P_{1} \ldots$ is fair but not live since the process $\mathrm{P}_{2}$ will never enter its critical section.

## A Useful Properties

In this appendix section, we state and prove some useful properties concerning some of the notions in the main body of the paper. They are not related to each other, but just useful to prove the main statements.

Proposition A. 1 Let $Q \in \tilde{\mathbb{P}}, A, A^{\prime} \subseteq \mathbb{A}_{\tau}$ and $\alpha \in \mathbb{A}_{\tau}$.

1. $\alpha \in \mathcal{U}(Q, A)$ implies $\alpha \notin A$;
2. $\alpha \in \mathcal{U}(Q, A)$ and $\alpha \notin A^{\prime}$ implies $\alpha \in \mathcal{U}\left(Q, A^{\prime}\right)$;
3. $A \subseteq A^{\prime}$ implies $\mathcal{U}\left(Q, A^{\prime}\right) \subseteq \mathcal{U}(Q, A)$;
4. $\mathcal{U}(Q, A)=\mathcal{U}(Q) \backslash A$.

Proof: First we prove Items 1 and 2 by induction hypothesis on $Q \in \tilde{\mathbb{P}}$.
Nil, Var: $Q=$ nil, $Q=x$. These cases are not possible since $\mathcal{U}(Q, A)=\emptyset$.
Pref: $Q=\mu . P_{1}$ with $P_{1} \in \tilde{\mathbb{P}}_{1}$. the latter case.

1. $\alpha \in \mathcal{U}(Q, A) \neq \emptyset$ implies $\mu=\underline{\alpha}$ and $\alpha \notin A$.
2. Again $\alpha \in \mathcal{U}(Q, A) \neq \emptyset$ implies $\mu=\underline{\alpha}$ and $\alpha \notin A$. Thus, $\alpha \notin A^{\prime} \operatorname{implies} \mathcal{U}\left(Q, A^{\prime}\right)=\{\alpha\}$ and, hence, $\alpha \in \mathcal{U}\left(Q, A^{\prime}\right)$.

Read: $Q=\mu \triangleright Q_{1}$.

1. $\alpha \in \mathcal{U}(Q, A) \neq \emptyset$ implies either $\mu=\underline{\alpha}$ and $\alpha \notin A$ or $\alpha \in \mathcal{U}\left(Q_{1}, A\right)$. Let us consider only the latter case (since in the former one there is noting to prove). Then, by induction hypothesis, it is $\alpha \notin A$.
2. Again $\alpha \in \mathcal{U}(Q, A) \neq \emptyset$ implies either $\mu=\underline{\alpha}$ and $\alpha \notin A$ or $\alpha \in \mathcal{U}\left(Q_{1}, A\right)$. In the former case, $\mu=\underline{\alpha}$ and $\alpha \notin A^{\prime}$ implies $\alpha \in \mathcal{U}\left(Q, A^{\prime}\right)$. In the latter one, $\alpha \in \mathcal{U}\left(Q_{1}, A\right)$ and $\alpha \notin A^{\prime}$ implies, by induction hypothesis, $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime}\right) \subseteq \mathcal{U}\left(Q, A^{\prime}\right)$.

Sum: $Q=Q_{1}+Q_{2}$

1. $\alpha \in \mathcal{U}(Q, A)$ implies $\alpha \in \mathcal{U}\left(Q_{1}, A\right)$ or $\alpha \in \mathcal{U}\left(Q_{2}, A\right)$. In both cases, by induction hypothesis, $\alpha \notin A$.
2. $\alpha \in \mathcal{U}(Q, A)$ implies (i) $\alpha \in \mathcal{U}\left(Q_{1}, A\right)$ or (ii) $\alpha \in \mathcal{U}\left(Q_{2}, A\right)$. Consider the case (i) (the other one is similar). $\alpha \in \mathcal{U}\left(Q_{1}, A\right)$ and $\alpha \notin A^{\prime}$ implies, by induction hypothesis, $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime}\right) \subseteq \mathcal{U}\left(Q, A^{\prime}\right)$.

Par: $Q=Q_{1} \|_{B} Q_{2}$.

1. Assume $\alpha \in \mathcal{U}(Q, A)$ and consider the following possible subcases.

- $\alpha \in \mathcal{U}\left(Q_{1}, A \cup B\right)$. By induction hypothesis $\mu \notin A \cup B$ and, hence, $\mu \notin A$.
- $\alpha \in \mathcal{U}\left(Q_{2}, A \cup B\right)$ or $\alpha \in\left(\mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right)\right) \cap B$. Both these cases can be proven as the previous one.

2. Assume $\alpha \in \mathcal{U}(Q, A), \alpha \notin A^{\prime}$ and consider the following possible subcases.

- $\alpha \in \mathcal{U}\left(Q_{1}, A \cup B\right)$. By Item 1, we have that $\alpha \notin A \cup B$ and, hence, $\alpha \notin B$. By induction hypothesis $\alpha \in \mathcal{U}\left(Q_{1}, A \cup B\right)$ and $\alpha \notin A^{\prime} \cup B$ implies $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime} \cup B\right)$.
- $\alpha \in \mathcal{U}\left(Q_{2}, A \cup B\right)$. Similar to the previous case.
- $\alpha \in\left(\mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right)\right) \cap B$. In such a case, by induction hypothesis, we have that $\alpha \in\left(\mathcal{U}\left(Q_{1}, A^{\prime}\right) \cap \mathcal{U}\left(Q_{2}, A^{\prime}\right)\right) \cap B \subseteq \mathcal{U}\left(Q, A^{\prime}\right)$.

Rel: $Q=Q_{1}[\Phi]$.

1. If $\alpha \in \mathcal{U}(Q, A)=\Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)\right)$ then $\alpha=\Phi(\beta)$ for some $\beta \in \mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)$. By induction hypothesis $\beta \notin \Phi^{-1}(A)=\{\gamma \mid \Phi(\gamma) \in A\}$ and, hence, $\alpha \notin A$.
2. Again $\alpha \in \mathcal{U}(Q, A)=\Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)\right)$ then $\alpha=\Phi(\beta)$ for some $\beta \in \mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)$. Moreover $\alpha \notin A^{\prime}$ implies $\beta \notin \Phi^{-1}\left(A^{\prime}\right)$ and, by induction hypothesis, $\beta \in \mathcal{U}\left(Q_{1}, \Phi^{-1}\left(A^{\prime}\right)\right)$. Thus $\alpha=\Phi(\beta) \in \Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}\left(A^{\prime}\right)\right)\right)=\mathcal{U}\left(Q, A^{\prime}\right)$.

Rec: $Q=\operatorname{rec} x \cdot Q_{1}$.

1. $\alpha \in \mathcal{U}(Q, A)=\mathcal{U}\left(Q_{1}, A\right)$ implies, by induction hypothesis, $\alpha \notin A$.
2. $\alpha \in \mathcal{U}(Q, A)=\mathcal{U}\left(Q_{1}, A\right)$ and $\alpha \notin A^{\prime}$ implies, by induction hypothesis, $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime}\right)=$ $\mathcal{U}\left(Q, A^{\prime}\right)$.

Now we can prove Items 3 . and 4.
3. Assume $\alpha \in \mathcal{U}\left(Q, A^{\prime}\right)$. Then, by Item $1, \alpha \notin A^{\prime}$ and, since $A \subseteq A^{\prime}, \alpha \notin A$. Thus, $\alpha \in \mathcal{U}\left(Q, A^{\prime}\right)$, $\alpha \notin A$ and Item 2. imply $\alpha \in \mathcal{U}(Q, A)$.
4. By Item $2, \alpha \in \mathcal{U}(Q) \backslash A$, i.e. $\alpha \in \mathcal{U}(Q)$ and $\alpha \notin A$, implies $\alpha \in \mathcal{U}(Q, A)$. Moreover, Items 3. implies $\mathcal{U}(Q, A) \subseteq \mathcal{U}(Q)$ (since it is always $\emptyset \subseteq A)$. Finally, $\alpha \in \mathcal{U}(Q, A)$ and Item 1. implies $\alpha \notin A$. Thus we can conclude that $\mathcal{U}(Q, A) \subseteq \mathcal{U}(Q) \backslash A$.

Proposition A. 2 Let $Q, R \in \tilde{\mathbb{P}}, x \in \mathcal{X}$ action-guarded in $Q$ and $A \subseteq \mathbb{A}_{\tau}$. Then $\mathcal{U}(Q\{R / x\}, A)=$ $\mathcal{U}(Q, A)$.

Proof: We proceed by induction on $Q \in \tilde{\mathbb{P}}$.
Nil: $Q=$ nil. In this case $x$ is action-guarded in $Q$ and $Q\{R / x\}=$ nil. Thus $\mathcal{U}(Q\{R / x\}, A)=$ $\mathcal{U}(Q, A)=\emptyset$.

Var: $Q=y . x$ action-guarded in $Q$ implies $x \neq y$ and $Q\{R / x\}=y$. Similar to the Nil-case.
Pref: $Q=\alpha . P_{1}$ or $Q=\underline{\alpha} \cdot P_{1}$. We prove only the latter case (the formes is simpler). In this case $x$ is guarded in $Q$ and $Q\{R / x\}=\underline{\alpha} \cdot\left(P_{1}\{R / x\}\right)$. If $\alpha \notin A$ then $\mathcal{U}(Q\{R / x\}, A)=\mathcal{U}(Q, A)=\{\alpha\}$. Otherwise, $\mathcal{U}(Q\{R / x\}, A)=\mathcal{U}(Q, A)=\emptyset$.

Read: $Q=\alpha \triangleright Q_{1}$ or $Q=\underline{\alpha} \triangleright Q_{1}$. Again we prove only the latter case. In this case $x$ actionguarded in $Q$ implies $x$ action-guarded in $Q_{1}$ and $Q\{R / x\}=\underline{\alpha} \triangleright\left(Q_{1}\{R / x\}\right)$. If $\alpha \notin A$ then, by induction hypothesis, $\mathcal{U}(Q\{R / x\}, A)=\{\alpha\} \cup \mathcal{U}\left(Q_{1}\{R / x\}, A\right)=\{\alpha\} \cup \mathcal{U}\left(Q_{1}, A\right)$. Otherwise, also by induction hypothesis, $\mathcal{U}(Q\{R / x\}, A)=\mathcal{U}\left(Q_{1}\{R / x\}, A\right)=\mathcal{U}\left(Q_{1}, A\right)=\mathcal{U}(Q, A)$.

Sum: $Q=Q_{1}+Q_{2}$. In this case $x$ action-guarded in $Q$ implies $x$ action-guarded in both $Q_{1}$ and in $Q_{2}$. Moreover $Q\{R / x\}=Q_{1}\{R / x\}+Q_{2}\{R / x\}$. By induction hypothesis, we have that $\mathcal{U}(Q\{R / x\}, A)=\mathcal{U}\left(Q_{1}\{R / x\}, A\right) \cup \mathcal{U}\left(Q_{2}\{R / x\}, A\right)=\mathcal{U}\left(Q_{1}, A\right) \cup \mathcal{U}\left(Q_{2}, A\right)=\mathcal{U}(Q, A)$.

Par: $Q=Q_{1} \|_{B} Q_{2}$. Again, $x$ acion-guarded in $Q$ implies $x$ action-guarded in $Q_{1}$ and in $Q_{2}$. Moreover $Q\{R / x\}=Q_{1}\{R / x\} \|_{B} Q_{2}\{R / x\}$. By induction hypothesis $\mathcal{U}(Q\{R / x\}, A)=$ $\mathcal{U}\left(Q_{1}\{R / x\}, A \cup B\right) \cup \mathcal{U}\left(Q_{2}\{R / x\}, A \cup B\right) \cup\left(\mathcal{U}\left(Q_{1}\{R / x\}, A\right) \cap \mathcal{U}\left(Q_{2}\{R / x\}, A\right) \cap B\right)=$ $\mathcal{U}\left(Q_{1}, A \cup B\right) \cup \mathcal{U}\left(Q_{2}, A \cup B\right) \cup\left(\mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B\right)=\mathcal{U}(Q, A)$.
Rel: $Q=Q_{1}[\Phi]$. In this case $x$ action-guarded in $Q$ implies $x$ action-guarded in $Q_{1}$ and $Q\{R / x\}=$ $\left(Q_{1}\{R / x\}\right)[\Phi]$. By induction hypothesis, it is $\mathcal{U}(Q\{R / x\}, A)=\Phi\left(\mathcal{U}\left(Q_{1}\{R / x\}, \Phi^{-1}(A)\right)\right)=$ $\Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)\right)=\mathcal{U}(Q, A)$.
Rec: $Q=\operatorname{rec} y . Q_{1}$. If $x=y$ then $Q\{R / x\}=Q$ and the statement follows easily. Assume $x \neq y$. Then $x$ action-guarded in $Q$ implies $x$ action-guarded in $Q_{1}$ and $Q\{R / x\}=$ rec $y .\left(Q_{1}\{R / x\}\right)$. By induction hypothesis $\mathcal{U}(Q\{R / x\}, A)=\mathcal{U}\left(Q_{1}\{R / x\}, A\right)=\mathcal{U}\left(Q_{1}, A\right)=\mathcal{U}(Q, A)$.

By Proposition 5.3 both Proposition A. 1 and A. 2 also hold for labelled terms.
Proposition A. 3 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}}), A$ and $A^{\prime} \subseteq \mathbb{A}_{\tau}$ with $A \subseteq A^{\prime}$. Then

1. $\operatorname{LE}\left(Q, A^{\prime}\right) \subseteq \operatorname{LE}(Q, A)$;
2. $\mathrm{UE}\left(Q, A^{\prime}\right) \subseteq \mathrm{UE}(Q, A)$;

Proof: We only prove $\operatorname{LE}\left(Q, A^{\prime}\right) \subseteq \operatorname{LE}(Q, A)$ by induction on $Q$. The proof for the urgent live events is similar.

Nil, Var: $Q=\operatorname{nil}_{u}, Q=x_{u}$. In these cases $\operatorname{LE}\left(Q, A^{\prime}\right)=\operatorname{LE}(Q, A)=\emptyset$.
Pref: $Q=\alpha_{u} \cdot P_{1}$ or $Q=\underline{\alpha}_{u} \cdot P_{1}$. In both cases $\alpha \notin A^{\prime}$ and $A \subseteq A^{\prime}$ imply $\alpha \notin A$ and hence $\operatorname{LE}\left(Q, A^{\prime}\right)=\operatorname{LE}(Q, A)=\{u\}$. Otherwise, i.e. if $\alpha \in A^{\prime}$, it is $\emptyset=\operatorname{LE}\left(Q, A^{\prime}\right) \subseteq \operatorname{LE}(Q, A)$.
Read: $Q=\alpha_{u 1} \triangleright_{u} Q_{1}$ or $Q=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}$. Assume $\alpha \notin A^{\prime}$ and hence (as in the previous case) $\alpha \notin A$. By induction hypothesis, $\mathrm{LE}\left(Q, A^{\prime}\right)=\{u 1\} \cup \mathrm{LE}\left(Q_{1}, A^{\prime}\right) \subseteq\{u 1\} \cup \operatorname{LE}\left(Q_{1}, A\right)=\mathrm{LE}(Q, A)$. If $\alpha \in A^{\prime}$ then, again by induction hypothesis, it is $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, A^{\prime}\right) \subseteq \operatorname{LE}\left(Q_{1}, A\right) \subseteq$ $\operatorname{LE}(Q, A)$.

Sum: $Q=Q_{1}+{ }_{u} Q_{2}$. By induction hypothesis it is $\operatorname{LE}\left(Q_{i}, A^{\prime}\right) \subseteq \operatorname{LE}\left(Q_{i}, A\right)$ for $i=1,2$. Thus, $\operatorname{LE}\left(Q_{1}+{ }_{u} Q_{2}, A^{\prime}\right)=\operatorname{LE}\left(Q_{1}, A^{\prime}\right) \cup \operatorname{LE}\left(Q_{2}, A^{\prime}\right) \subseteq \operatorname{LE}\left(Q_{1}, A\right) \cup \operatorname{LE}\left(Q_{2}, A\right)=\operatorname{LE}\left(Q_{1}+{ }_{u} Q_{2}, A\right)$.

Par: $Q=Q_{1} \|_{B}^{u} Q_{2} . A \subseteq A^{\prime}$ implies $A \cup B \subseteq A^{\prime} \cup B$ and $B \backslash A^{\prime} \subseteq B \backslash A$. Thus, by induction hypothesis, $\operatorname{LE}\left(Q_{1}, A^{\prime} \cup B\right) \subseteq \operatorname{LE}\left(Q_{1}, A \cup B\right), \operatorname{LE}\left(Q_{2}, A^{\prime} \cup B\right) \subseteq \operatorname{LE}\left(Q_{2}, A \cup B\right)$ and, let $A_{\alpha}=$ $\operatorname{LE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \cap \operatorname{LE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right), \bigcup_{\alpha \in B \backslash A^{\prime}} A_{\alpha} \subseteq \bigcup_{\alpha \in B \backslash A} A_{\alpha}$. Hence $\operatorname{LE}\left(Q, A^{\prime}\right) \subseteq \operatorname{LE}(Q, A)$.
Rel, Rec: Similar to the previous cases.

Proposition A. 4 Let $Q, R \in \mathrm{~L}(\tilde{\mathbb{P}})$ and $A \subseteq \mathbb{A}_{\tau}$.

1. $\mathrm{LE}(Q, A) \subseteq \operatorname{LE}(Q\{|R / x|\}, A)$. If $x \in \mathcal{X}$ action-guarded in $Q$ then $\operatorname{LE}(Q\{|R / x|\}, A) \subseteq \operatorname{LE}(Q, A)$.
2. $\mathrm{UE}(Q, A) \subseteq \mathrm{UE}(Q\{\mid R / x\}, A)$. If $x \in \mathcal{X}$ action-guarded in $Q$ then $\mathrm{UE}(Q\{|R / x|\}, A) \subseteq$ $\mathrm{UE}(Q, A)$.
3. $x$ action-guarded in $Q$ implies that $Q \xrightarrow{\alpha}$ if only if $Q\{|R / x|\} \xrightarrow{\mu}$.

Proof: We only prove Item 1 and Item 3 (Item 2 is similar to Item 1). To prove Item 1 we proceed by induction on $Q$ while to prove Item 3 we proceed by induction on the derivations $Q \xrightarrow{\alpha}$ and $Q\{|R / x|\} \xrightarrow{\alpha}_{r}$.

Nil: $Q=$ nil $_{u}$. In this case $x$ is action-guarded in $Q$ and $Q\{|R / x|\}=$ nil.

1. $\operatorname{LE}(Q, A)=\emptyset=\operatorname{LE}(Q\{|R / x|\}, A)$.
2. $\operatorname{nil}_{u} \xrightarrow{q}$ and $\operatorname{nil}_{u}\{|Q / x|\}=\operatorname{nil}_{u} \xlongequal{q}$.

Var: $Q=y_{u}$.

1. $\operatorname{LE}(Q, A)=\emptyset \subseteq \operatorname{LE}(Q\{R / x \mid\})$. Assume $x$ action-guarded in $Q$ and, hence, $x \neq y$. Then $Q\{|R / x|\}=y_{u}$ and $\operatorname{LE}(Q\{|R / x|\}, A)=\operatorname{LE}(Q, A)=\emptyset$
2. As in the previous case $x$ action-guarded in $Q$ implies $x \neq y$ and $Q\{|R / x|\}=y_{u}$. By operational rules we have both $Q \xrightarrow{q}$ and $Q\{|R / x|\} \xrightarrow{q}$.

Pref: $Q=\mu_{u} \cdot P_{1}$. Then $Q\{|R / x|\}=\mu_{u} \cdot\left(P_{1}\{|R / x|\}\right)$ and $x$ is action-guarded in $Q$.

1. If $\mu \in\{\alpha, \underline{\alpha}\}$ and $\alpha \notin A$ then $\operatorname{LE}(Q, A)=\{\langle u\rangle\}=\operatorname{LE}(Q\{|R / x|\})$. Otherwise, we have $\mathrm{LE}(Q, A)=\mathrm{LE}(Q\{|R / x|\}, A)=\emptyset$.
2. $Q \xrightarrow{\alpha}$ if and only if $\mu \in\{\alpha, \underline{\alpha}\}$ if and only if, by operational rules, $Q\{|R / x|\} \xrightarrow{\alpha}$.

Read: $Q=\mu_{u 1} \triangleright_{u} Q_{1}$. Then $Q\{|R / x|\}=\mu_{u 1} \triangleright_{u}\left(Q_{1}\{R / x \mid\}\right)$ and $x$ action-guarded in $Q$ implies $x$ action-guarded in $Q_{1}$.

1. If $\mu \in\{\alpha, \underline{\alpha}\}$ and $\alpha \notin A$ then $\operatorname{LE}(Q, A)=\{\langle u 1\rangle\} \cup \operatorname{LE}\left(Q_{1}, A\right) \subseteq\{\langle u 1\rangle\} \cup \operatorname{LE}\left(Q_{1}\{|R / x|\}\right)$. Otherwise, we have $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, A\right) \subseteq \operatorname{LE}\left(Q_{1}\{|R / x|\}, A\right) \subseteq \operatorname{LE}(Q\{|R / x|\}, A)$.
2. $Q \xrightarrow{\alpha}$ if and only if either $\mu \in\{\alpha, \underline{\alpha}\}$ or $Q_{1} \xrightarrow{\alpha}$ if and only if, by induction hypothesis, either $\mu \in\{\alpha, \underline{\alpha}\}$ or $Q_{1}\{|R / x|\} \xrightarrow{\alpha}$. Finally, by operational rules, we can conclude that $Q \xrightarrow{\alpha}$ if and only if $Q\{|R / x|\} \xrightarrow{\alpha}$.

Sum: $Q=Q_{1}+{ }_{u} Q_{2}$. In this case $Q\{|R / x|\}=Q_{1}\{|R / x|\}+{ }_{u} Q_{2}\{R / x \mid\}$.

1. By induction hypothesis it is $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, A\right) \cup \operatorname{LE}\left(Q_{2}, A\right) \subseteq \operatorname{LE}\left(Q_{1}\{|R / x|\}, A\right) \cup$ $\mathrm{LE}\left(Q_{2}\{R / x \mid\}, A\right)=\mathrm{LE}(Q\{|R / x|\}, A)$. Moreover, if is $x$ action-guarded in $Q$ then it is action-guarded in both $Q_{1}$ and in $Q_{2}$ and, by induction hypothesis, $\operatorname{LE}(Q\{|R / x|\}, A)=$ $\operatorname{LE}\left(Q_{1}\{|R / x|\}, A\right) \cup \operatorname{LE}\left(Q_{2}\{|R / x|\}, A\right) \subseteq \operatorname{LE}\left(Q_{1}, A\right) \cup \operatorname{LE}\left(Q_{2}, A\right)=\operatorname{LE}(Q, A)$.
2. Assume $x$ action-guarded in $Q$ and, hence, in $Q_{1}$ and in $Q_{2}$. By operational rules we have that $Q \xrightarrow{\alpha}$ if and only if either $Q_{1} \xrightarrow{\alpha}$ or $Q_{2} \xrightarrow{\alpha}$ if only if, by induction hypothesis, either $Q_{1}\{|R / x|\} \xrightarrow{\alpha}$ or $Q_{2}\{|R / x|\} \xrightarrow{\alpha}$ if only if, again by operational rules, $Q\{|R / x|\} \xrightarrow{\alpha}$.

Par: $Q=Q_{1} \|_{B}^{u} Q_{2}$. In this case $Q\{|R / x|\}=Q_{1}\{|R / x|\} \|_{B}^{u} Q_{2}\{|R / x|\}$.

1. By inductive reasoning as the previous case.
2. Assume $x$ action-guarded in $Q$ (and, hence, $x$ action-guarded in $Q_{1}$ and in $Q_{2}$ ). Consider the following possible subcases:

- $\alpha \notin B$. By operational rules $Q \xrightarrow{\alpha}$ if and only if either $Q_{1} \xrightarrow{\alpha}$ or $Q_{2} \xrightarrow{\alpha}$ if only if, by induction hypothesis, either $Q_{1}\{|R / x|\} \xrightarrow{\alpha}$ or $Q_{2}\{|R / x|\} \xrightarrow{\alpha}$ if only if, again by operational rules, $Q\{|R / x|\} \xrightarrow{\alpha}$.
- $\alpha \in B$. By operational rules $Q \xrightarrow{\alpha}$ if and only if $Q_{1} \xrightarrow{\alpha}$ and $Q_{2} \xrightarrow{\alpha}$ if only if, by induction hypothesis, $Q_{1}\{\mid R / x\} \xrightarrow{\alpha}$ and $Q_{2}\{R / x\} \xrightarrow{\alpha}$ if only if, again by operational rules, $Q\{\mid R / x\} \xrightarrow{\alpha}$.

Rel: $Q=Q_{1}\left[\Phi_{u}\right]$. In this case $Q\{R / x \mid\}=\left(Q_{1}\left[\Phi_{u}\right]\right)\{\mid R / x\}=\left(Q_{1}\{|R / x|\}\right)\left[\Phi_{u}\right]$

1. By induction hypothesis it is $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, \Phi^{-1}(A)\right) \subseteq \operatorname{LE}\left(Q_{1}\{R / x\}, \Phi^{-1}(A)\right)=$ $\mathrm{LE}(Q\{\mid R / x\}, A)$. If $x$ is action-guarded in $Q$ and, hence in $Q_{1}$, again by induction hypothesis, we have that $\operatorname{LE}(Q\{\mid R / x\}, A)=\operatorname{LE}\left(Q_{1}\{R / x \mid\}, \Phi^{-1}(A)\right) \subseteq \operatorname{LE}\left(Q_{1}, \Phi^{-1}(A)\right)=$ $\mathrm{LE}(Q, A)$.
2. Assume $x$ action-guarded in $Q$ and, hence, in $Q_{1} . Q \xrightarrow{\alpha}$ if only if there exists $\beta \in \Phi^{-1}(\alpha)$ such that $Q_{1} \xrightarrow{\beta}$. By induction hypothesis $Q_{1} \xrightarrow{\beta}$ if and only if $\left.Q_{1}\{R / x\}\right\} \xrightarrow{\beta}$ if only if, again by operational rules, $Q\{\mid R / x\} \xrightarrow{\alpha}$.

Rec: $Q=\operatorname{rec} y_{u} \cdot Q_{1}$. If $x=y$ then $x$ is action-guarded in $Q, Q\{R / x\}=Q$ and both statements follow easily. We can assume $x \neq y$ and $Q\{\mid R / x\}=\operatorname{rec} y_{u} \cdot\left(Q_{1}\{R / x\}\right)$. By induction hypothesis:

1. $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, A\right) \subseteq \operatorname{LE}\left(Q_{1}\{R / x\}, A\right)=\operatorname{LE}(Q\{|R / x|\}, A)$. Now assume $x$ actionguarded in $Q$ and, hence, in $Q_{1}$. By induction hypothesis it is $\operatorname{LE}(Q\{R / x\}, A)=$ $\operatorname{LE}\left(Q_{1}\{R / x \mid\}, A\right) \subseteq \operatorname{LE}\left(Q_{1}, A\right)=\operatorname{LE}(Q, A)$.
2. Assume $x$ action-guarded in $Q$ and, hence, in $Q_{1}$. Then, by operational rules, $Q \underset{\rightsquigarrow}{\alpha}$ iff $Q_{1} \xrightarrow[\sim]{\alpha}$ iff, by induction hypothesis, $Q_{1}\{R / x \mid\} \stackrel{\alpha}{\rightsquigarrow}$ iff, again by operational rules, $Q\{\mid R / x\} \stackrel{\alpha}{\rightsquigarrow}$. Now, let us denote with $R_{1}=\operatorname{unmark}\left(Q_{1}\right)$ and $S=Q_{1}\left\{\mid r e c y_{u} \cdot R_{1} / y\right\}$. Then $x$ action-guarded in $Q_{1}$ implies $x$ action-guarded also in $R_{1}=\operatorname{unmark}\left(Q_{1}\right)$ and $S=Q_{1}\left\{\right.$ rec $\left.y_{u} \cdot R_{1} / y\right\}$. Moreover, $x$ action-guarded in $Q_{1}$ and Proposition A.7-2 implies unmark $(S)=\operatorname{unmark}\left(Q_{1}\{\mid R / x\}\right)=\operatorname{unmark}\left(Q_{1}\right)\{\mid R / x\}=R_{1}\{|R / x|\}$. As a consequence, $\left.S\{\mid R / x\}=\left(Q_{1}\left\{\operatorname{rec} y_{u} \cdot R_{1} / y \mid\right\}\right)\{R / x \mid\}=\left(Q_{1}\{|R / x|\}\right)\left\{\operatorname{rec} y_{u} \cdot\left(R_{1}\{R / x \mid\}\right) / y\right\}\right\}=$ $S\left\{\operatorname{rec} y_{u}\right.$.unmark $\left.(S) / y\right\}$. Notice that, by operational rules, we have that $Q\{R / x \mid\}=$ rec $y_{u} \cdot\left(Q_{1}\{|R / x|\}\right)=$ rec $y_{u} \cdot S \stackrel{\alpha}{\mapsto}$ if and only if $S\left\{\mid \operatorname{rec} y_{u}\right.$.unmark $\left.(S) / y\right\}=S\{\mid R / x\} \stackrel{\alpha}{\mapsto}$. Finally, by operational rules, $Q \stackrel{\alpha}{\mapsto}$ if only if $S \stackrel{\alpha}{\mapsto}$ if only if, since $x$ is action-guarded in $S$ and by induction hypothesis, $S\{|R / x|\} \stackrel{\alpha}{\mapsto}$ if only if (see above) $Q\{\mid R / x\}\} \stackrel{\alpha}{\mapsto}$.

## A. 1 clean and unmark Properties

In this appendix section we prove some useful properties of functions clean and unmark. Most of them are stated for terms in $\tilde{\mathbb{P}}$ but, since the "action" of removing urgencies does not depend from labels we can easily prove that they also hold for terms in $\mathrm{L}(\tilde{\mathbb{P}})$.

Proposition A. 5 Let $Q \in \tilde{\mathbb{P}}$ and $A \subseteq \mathbb{A}$. Then:

1. $\operatorname{unmark}(\operatorname{clean}(Q, A))=\operatorname{unmark}(Q) \in \tilde{\mathbb{P}}_{1}$;
2. $Q \in \tilde{\mathbb{P}}_{1}$ implies clean $(Q, A)=\operatorname{unmark}(Q)=Q$;
3. $\mathcal{U}(Q, A)=\emptyset$ implies clean $(Q, A)=\operatorname{unmark}(Q)$.

Proof: We prove, by induction on $Q \in \tilde{\mathbb{P}}$, only the latter item. Items 1 and 2 follow directly from Definitions 2.3 and 2.4.

Nil, Var: $Q=$ nil, $Q=x$. In these cases $\mathcal{U}(Q, A)=\emptyset$ and clean $(Q, A)=\operatorname{unmark}(Q)=Q$ for any $A$.
Pref: $Q=\alpha . P_{1}$ or $Q=\underline{\alpha} . P_{1}$ with $P_{1} \in \tilde{\mathbb{P}}_{1}$. We only prove the latter case (since the former one follows easily). Assume $\mathcal{U}(Q, A)=\emptyset$. Then, by Definition 2.2, we have $\alpha \in A$ and hence clean $(Q, A)=\alpha \cdot P_{1}=\operatorname{unmark}(Q)$.

Read: $Q=\alpha \triangleright Q_{1}$ or $Q=\underline{\alpha} \triangleright Q_{1}$. Again we only prove the latter case. Assume $\mathcal{U}(Q, A)=\emptyset$. Then, by Definition 2.2, we have $\alpha \in A$ and $\mathcal{U}\left(Q_{1}, A\right)=\emptyset$. Hence, clean $(Q, A)=\alpha \triangleright$ clean $\left(Q_{1}, A\right)=$ $\alpha \triangleright \operatorname{unmark}\left(Q_{1}\right)=\operatorname{unmark}(Q)$.

Sum: $Q=Q_{1}+Q_{2}$. Assume $\mathcal{U}(Q, A)=\mathcal{U}\left(Q_{1}, A\right) \cup \mathcal{U}\left(Q_{2}, A\right)=\emptyset$. By induction hypothesis $\operatorname{clean}(Q, A)=\operatorname{clean}\left(Q_{1}, A\right)+\operatorname{clean}\left(Q_{2}, A\right)=\operatorname{unmark}\left(Q_{1}\right)+\operatorname{unmark}\left(Q_{2}\right)=\operatorname{unmark}(Q)$.

Par: $Q=Q_{1} \|_{B} Q_{2}$. Let $A_{1}=A \cup\left(B \backslash \mathcal{U}\left(Q_{2}\right)\right)$ and $A_{2}=A \cup\left(B \backslash \mathcal{U}\left(Q_{1}\right)\right) B$. We first prove that $\mathcal{U}(Q, A)=\emptyset$ (and hence, by Definition 2.2, $\mathcal{U}\left(Q_{1}, A \cup B\right)=\mathcal{U}\left(Q_{2}, A \cup B\right)=\emptyset$ and $\left.\mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B=\emptyset\right)$ implies $\mathcal{U}\left(Q_{1}, A_{1}\right)=\mathcal{U}\left(Q_{2}, A_{2}\right)=\emptyset$.
Assume, toward a contradiction, that $\alpha \in \mathcal{U}\left(Q_{1}, A_{1}\right) \neq \emptyset$. and hence, by Proposition A.11., that $\alpha \notin A_{1}$ (that is $\alpha \notin A$ and $\left.\alpha \notin B \backslash \mathcal{U}\left(Q_{2}\right)\right)$. We distinguish two possible subcases: (i) $\alpha \notin B$ and (ii) $\alpha \in B$. In the (i)-case, $\alpha \in \mathcal{U}\left(Q_{1}, A_{1}\right)$ and $\alpha \notin A \cup B$ implies (by Proposition A.1-2.) $\alpha \in \mathcal{U}\left(Q_{1}, A \cup B\right)=\emptyset$. In the (ii)-case, $\alpha \in B$ and $\alpha \notin B \backslash \mathcal{U}\left(Q_{2}\right)$ implies $\alpha \in \mathcal{U}\left(Q_{2}\right)$. Thus $\alpha \in \mathcal{U}\left(Q_{1}, A_{1}\right) \cap \mathcal{U}\left(Q_{2}\right) \cap B$ and $\alpha \notin A$ implies (again Proposition A.1-2.) $\alpha \in \mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B=\emptyset$. Similarly we can prove that $\mathcal{U}\left(Q_{2}, A_{2}\right)=\emptyset$.
Finally, by induction hypothesis, $\mathcal{U}\left(Q_{1}, A_{1}\right)=\emptyset$ and $\mathcal{U}\left(Q_{2}, A_{2}\right)=\emptyset$ imply clean $(Q, A)=$ clean $\left(Q_{1}, A_{1}\right) \|_{B}$ clean $\left(Q_{2}, A_{2}\right)=\operatorname{unmark}\left(Q_{1}\right) \|_{B} \operatorname{unmark}\left(Q_{2}\right)=\operatorname{unmark}(Q)$.
Rel: $Q=Q_{1}[\Phi] . \mathcal{U}(Q, A)=\Phi^{-1}\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)\right)=\emptyset$ implies $\mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)=\emptyset$ and, by induction hypothesis, $\operatorname{clean}(Q, A)=\operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right)[\Phi]=\operatorname{unmark}\left(Q_{1}\right)[\Phi]=\operatorname{unmark}(Q)$.
Rec: $Q=\operatorname{rec} x . Q_{1}$. By induction hypothesis $\mathcal{U}(Q, A)=\mathcal{U}\left(Q_{1}, A\right)=\emptyset$ implies clean $(Q, A)=$ rec $x$.clean $\left(Q_{1}, A\right)=\operatorname{rec} x$.unmark $\left(Q_{1}\right)=\operatorname{unmark}(Q)$.

Proposition A. 6 Let $Q \in \tilde{\mathbb{P}}, A, A^{\prime} \subseteq \mathbb{A}$ and $A^{\prime \prime} \subseteq \mathbb{A}_{\tau}$. Then:

1. $A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=\emptyset$ implies clean $(Q, A)=$ clean $\left(Q, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)$;
2. $\mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)$;
3. $\mathcal{A}\left(\right.$ clean $\left.(Q, A), A^{\prime \prime}\right)=\mathcal{A}\left(Q, A^{\prime \prime}\right)$

Proof: We prove Item 1. and 2. by induction on $Q$. Item 3. follows directly from Definitions 2.6 and 2.3.

Nil, Var: $Q=$ nil, $Q=x$. In these cases we have that

1. $\operatorname{clean}(Q, A)=\operatorname{clean}\left(Q, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)=Q$.
2. $\mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)=\emptyset$.

Pref: $Q=\alpha . P_{1}$ or $Q=\underline{\alpha} . P_{1}$. We prove only the latter case (the former one follows easily since $\left.Q \in \tilde{\mathbb{P}}_{1}\right)$.

1. If $\alpha \in A^{\prime \prime}$ then, trivially, $\alpha \notin A^{\prime} \backslash A^{\prime \prime}$. If $\alpha \notin A^{\prime \prime}, A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=A^{\prime} \cap\{\alpha\}=\emptyset$ implies $\alpha \notin A^{\prime}$ and, again, $\alpha \notin A^{\prime} \backslash A^{\prime \prime}$. In both cases, $\alpha \in A$ if and only if $\alpha \in A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)$ and, by Definition 2.3, clean $(Q, A)=\operatorname{clean}\left(Q, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)$.
2. We have to consider two possible subcases:

- $\alpha \in A \subseteq A \cup A^{\prime \prime} . \mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\mathcal{U}\left(\alpha \cdot Q_{1}, A^{\prime}\right)=\emptyset=\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)$.
- $\alpha \notin A$. In this case clean $(Q, A)=Q$. Moreover, $\alpha \notin A$ implies $\alpha \in A^{\prime \prime}$ if and only if $\alpha \in A \cup A^{\prime \prime}$ and, by Definition $2.2, \mathcal{U}\left(Q, A^{\prime \prime}\right)=\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)$. Thus $\mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(Q, A^{\prime \prime}\right)=\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)$.

Read: $Q=\alpha \triangleright Q_{1}$ or $Q=\underline{\alpha} \triangleright Q_{1}$. Again we only prove the latter case (the former one is easier).

1. Assume $A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=\emptyset$. Since $\mathcal{U}\left(Q_{1}, A\right) \subseteq \mathcal{U}(Q, A)$ it is also $A^{\prime} \cap \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right)=\emptyset$ and, by induction hypothesis, clean $\left(Q_{1}, A\right)=\operatorname{clean}\left(Q_{1}, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)$. Moreover, if $\alpha \notin A^{\prime \prime}$ then $\alpha \in \mathcal{U}\left(Q, A^{\prime \prime}\right)$ and $A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=\emptyset$ implies $\alpha \notin A^{\prime}$ and, hence, $\alpha \notin A^{\prime} \backslash A^{\prime \prime}$. If, otherwise, $\alpha \in A^{\prime \prime}$ then it is trivially $\alpha \notin A^{\prime} \backslash A^{\prime \prime}$. In both cases we have that $\alpha \in A$ if and only if $\alpha \in A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)$. Thus, by Definition 2.3, we can conclude that clean $(Q, A)=\operatorname{clean}\left(Q, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)$.
2. We distinguish the following possible subcases:
(a) $\alpha \in A$.
$\mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(\alpha \triangleright \operatorname{clean}\left(Q_{1}, A\right), A^{\prime \prime}\right)=\mathcal{U}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime \prime}\right)=($ by induction hypothesis) $\mathcal{U}\left(Q_{1}, A \cup A^{\prime \prime}\right)=\left(\right.$ since $\left.\alpha \in A \cup A^{\prime \prime}\right) \mathcal{U}\left(\underline{\alpha} \triangleright Q_{1}, A \cup A^{\prime \prime}\right)$.
(b) $\alpha \notin A$ and $\alpha \notin A^{\prime \prime}$.
$\mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(\underline{\alpha} \triangleright \operatorname{clean}\left(Q_{1}, A\right), A^{\prime \prime}\right)=\{\alpha\} \cup \mathcal{U}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime \prime}\right)=($ by induction hypothesis) $\{\alpha\} \cup \mathcal{U}\left(Q_{1}, A \cup A^{\prime \prime}\right)=\left(\right.$ since $\left.\alpha \notin A \cup A^{\prime \prime}\right) \mathcal{U}\left(\underline{\alpha} \triangleright Q_{1}, A \cup A^{\prime \prime}\right)$.
(c) $\alpha \notin A$ and $\alpha \in A^{\prime \prime}$. This case is similar to the former one.

Sum: $Q=Q_{1}+Q_{2}$.

1. Assume $A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=\emptyset$. Then, since $\mathcal{U}\left(Q, A^{\prime \prime}\right)=\mathcal{U}\left(Q_{1}, A^{\prime \prime}\right) \cup \mathcal{U}\left(Q_{2}, A^{\prime \prime}\right)$, we also have $A^{\prime} \cap \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right)=A^{\prime} \cap \mathcal{U}\left(Q_{2}, A^{\prime \prime}\right)=\emptyset$. By induction hypothesis clean $(Q, A)=$ $\operatorname{clean}\left(Q_{1}, A\right)+\operatorname{clean}\left(Q_{2}, A\right)=\operatorname{clean}\left(Q_{1}, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)+\operatorname{clean}\left(Q_{2}, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)=$ clean $\left(Q, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)$.
2. By induction hypothesis it is $\mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(\operatorname{clean}\left(Q_{1}, A\right)+\operatorname{clean}\left(Q_{2}, A\right), A^{\prime \prime}\right)=$ $\mathcal{U}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime \prime}\right) \cup \mathcal{U}\left(\operatorname{clean}\left(Q_{2}, A\right), A^{\prime \prime}\right)=\mathcal{U}\left(Q_{1}, A \cup A^{\prime \prime}\right) \cup \mathcal{U}\left(Q_{2}, A \cup A^{\prime \prime}\right)=$ $\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)$.

Par: $Q=Q_{1} \|_{B} Q_{2}$. Let $A_{1}=B \backslash \mathcal{U}\left(Q_{2}\right)$ and $A_{2}=B \backslash \mathcal{U}\left(Q_{1}\right)$.

1. First we prove that $A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=\emptyset$ implies $\left(A \backslash A_{i}\right) \cap \mathcal{U}\left(Q_{i}, A^{\prime \prime}\right)=\emptyset$ for $i=1,2$.

Assume, by contradiction, $\alpha \in\left(A^{\prime} \backslash A_{1}\right) \cap \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right)$. Then $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right)$ such that $\alpha \in A^{\prime}, \alpha \notin A_{1}=B \backslash \mathcal{U}\left(Q_{2}\right)$ and $\alpha \notin A^{\prime \prime}$ (see Proposition A.1-1.). We further distinguish the following subcases: $\alpha \notin B$ and $\alpha \in B$. In the former case, $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right)$ and $\alpha \notin A^{\prime \prime} \cup B$ implies, Proposition A.1-2., $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime \prime} \cup B\right) \subseteq \mathcal{U}\left(Q, A^{\prime \prime}\right)$. Thus $\alpha \in A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=\emptyset$. Otherwise, if $\alpha \in B$ then $\alpha \notin A_{1}=B \backslash \mathcal{U}\left(Q_{2}\right)$ implies $\alpha \in \mathcal{U}\left(Q_{2}\right)$ and, hence, $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right) \cap \mathcal{U}\left(Q_{2}\right) \cap B$. Finally, $\alpha \notin A^{\prime \prime}$ and again Proposition A.1-2. imply $\alpha \in \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right) \cap \mathcal{U}\left(Q_{2}, A^{\prime \prime}\right) \cap B \subseteq \mathcal{U}\left(Q, A^{\prime \prime}\right)$. Again it is $\alpha \in A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=\emptyset$. We can conclude that $\left(A^{\prime} \backslash A_{1}\right) \cap \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right)=\emptyset$ and, similarly, that $\left(A^{\prime} \backslash A_{2}\right) \cap \mathcal{U}\left(Q_{2}, A^{\prime \prime}\right)=\emptyset$. By induction hypothesis it is clean $\left(Q_{i}, A \cup A_{i}\right)=$ clean $\left(Q_{i}, A \cup A_{i} \cup\left(\left(A^{\prime} \backslash A_{i}\right) \backslash A^{\prime \prime}\right)\right)=$ clean $\left(Q_{i}, A \cup A_{i} \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)$-because for generic sets $A, B$ and $C$ we have $A \cup((B \backslash A) \backslash C)=A \cup(B \backslash C)$-for $i=1,2$. Thus, clean $(Q, A)=$ $\operatorname{clean}\left(Q_{1}, A \cup A_{1}\right) \|_{B}$ clean $\left(Q_{2}, A \cup A_{2}\right)=\operatorname{clean}\left(Q_{1}, A \cup A_{1} \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right) \|_{B}$ clean $\left(Q_{2}, A \cup\right.$ $\left.A_{2} \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)=\operatorname{clean}\left(Q, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)$.
2. Let us denote, for $i=1,2, R_{i}=\operatorname{clean}\left(Q_{i}, A \cup A_{i}\right)$. Then, by Definition 2.3 it is clean $(Q, A)=R_{1} \|_{B} R_{2}$ and, by induction hypothesis, $\mathcal{U}\left(R_{i}, A^{\prime \prime} \cup B\right)=\mathcal{U}\left(Q_{i},(A \cup\right.$ $\left.\left.A_{1}\right) \cup\left(A^{\prime \prime} \cup B\right)\right)=\mathcal{U}\left(Q_{i},\left(A \cup A^{\prime \prime}\right) \cup B\right)$ (since $\left.A_{i} \subseteq B\right)$. Again by induction hypothesis, it is also $\mathcal{U}\left(R_{1}, A^{\prime \prime}\right) \cap \mathcal{U}\left(R_{2}, A^{\prime \prime}\right) \cap B=\mathcal{U}\left(Q_{1}, A \cup A_{1} \cup A^{\prime \prime}\right) \cap \mathcal{U}\left(Q_{2}, A \cup A_{2} \cup A^{\prime \prime}\right) \cap B \subseteq$ $\mathcal{U}\left(Q_{1}, A \cup A^{\prime \prime}\right) \cap \mathcal{U}\left(Q_{2}, A \cup A^{\prime \prime}\right) \cap B$ (this is because $A \cup A^{\prime \prime} \subseteq\left(A \cup A^{\prime \prime}\right) \cup A_{i}$ implies, by Proposition A.1-3 $\mathcal{U}\left(Q_{i}, A \cup A_{i} \cup A^{\prime \prime}\right) \subseteq \mathcal{U}\left(Q_{i}, A \cup A^{\prime \prime}\right)$ for $\left.i=1,2\right)$. Moreover, $\alpha \in \mathcal{U}\left(Q_{1}, A \cup A_{1} \cup A^{\prime \prime}\right) \cap \mathcal{U}\left(Q_{2}, A \cup A_{2} \cup A^{\prime \prime}\right) \cap B$ and Proposition A.1-1 implies $\alpha \notin A \cup A^{\prime \prime}$, and hence (by Proposition A.1-2) $\alpha \in \mathcal{U}\left(Q_{1}, A \cup A^{\prime \prime}\right) \cap \mathcal{U}\left(Q_{2}, A \cup A^{\prime \prime}\right) \cap B$. This allows us to conclude that $\mathcal{U}\left(R_{1}, A^{\prime \prime}\right) \cap \mathcal{U}\left(R_{2}, A^{\prime \prime}\right) \cap B=\mathcal{U}\left(Q_{1}, A \cup A^{\prime \prime}\right) \cap \mathcal{U}\left(Q_{2}, A \cup A^{\prime \prime}\right) \cap B$. Finally, by Definition $2.2, \mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(R_{1} \|_{B} R_{2}, A^{\prime \prime}\right)=\mathcal{U}\left(R_{1}, A^{\prime \prime} \cup B\right) \cup$ $\mathcal{U}\left(R_{2}, A^{\prime \prime} \cup B\right) \cup\left(\mathcal{U}\left(R_{1}, A^{\prime \prime}\right) \cap \mathcal{U}\left(R_{2}, A^{\prime \prime}\right) \cap B\right)=\mathcal{U}\left(Q_{1},\left(A \cup A^{\prime \prime}\right) \cup B\right) \cup \mathcal{U}\left(Q_{2},\left(A \cup A^{\prime \prime}\right) \cup\right.$ $B) \cup \mathcal{U}\left(Q_{1}, A \cup A^{\prime \prime}\right) \cap \mathcal{U}\left(Q_{2}, A \cup A^{\prime \prime}\right) \cap B=\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)$.

Rel: $Q=Q_{1}[\Phi]$.

1. Let ut assume $A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=A^{\prime} \cap \Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}\left(A^{\prime \prime}\right)\right)\right)=\emptyset$ and hence $\Phi^{-1}\left(A^{\prime}\right) \cap$ $\mathcal{U}\left(Q_{1}, \Phi^{-1}\left(A^{\prime \prime}\right)\right)=\emptyset$. By induction hypothesis clean $(Q, A)=\operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right)[\Phi]=$ clean $\left(Q_{1}, \Phi^{-1}(A) \cup\left(\Phi^{-1}\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)\right)[\Phi]=\operatorname{clean}\left(Q_{1}, \Phi^{-1}\left(A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)\right)[\Phi]=\operatorname{clean}(Q, A \cup$ $\left.\left.\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)\right)$
2. Let us denote with $R_{1}=\operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right)$. By induction hypothesis we have that $\mathcal{U}\left(R_{1}, \Phi^{-1}\left(A^{\prime \prime}\right)\right)=\mathcal{U}\left(Q_{1}, \Phi^{-1}(A) \cup \Phi^{-1}\left(A^{\prime \prime}\right)\right)=\mathcal{U}\left(Q_{1}, \Phi^{-1}\left(A \cup A^{\prime \prime}\right)\right)$. As a consequence, $\mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(R_{1}[\Phi], A^{\prime \prime}\right)=\Phi\left(\mathcal{U}\left(R_{1}, \Phi^{-1}\left(A^{\prime \prime}\right)\right)\right)=\Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}\left(A \cup A^{\prime \prime}\right)\right)\right)=$ $\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)$.

Rec: $Q=\operatorname{rec} x \cdot Q_{1}$.

1. If $A^{\prime} \cap \mathcal{U}\left(Q, A^{\prime \prime}\right)=A^{\prime} \cap \mathcal{U}\left(Q_{1}, A^{\prime \prime}\right)=\emptyset$ then, by induction hypothesis, clean $(Q, A)=$ rec $x$. clean $\left(Q_{1}, A\right)=\operatorname{rec} x$. clean $\left(Q_{1}, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)=\operatorname{clean}\left(Q, A \cup\left(A^{\prime} \backslash A^{\prime \prime}\right)\right)$.
2. $\mathcal{U}\left(\operatorname{clean}(Q, A), A^{\prime \prime}\right)=\mathcal{U}\left(\right.$ rec $\left.x . c l e a n ~\left(Q_{1}, A\right), A^{\prime \prime}\right)=\mathcal{U}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime \prime}\right)=\mathcal{U}\left(Q_{1}, A \cup A^{\prime \prime}\right)=$ $\mathcal{U}\left(Q, A \cup A^{\prime \prime}\right)$.

Proposition A. 7 Let $Q, R \in \tilde{\mathbb{P}}, x \in \mathcal{X}$ action-guarded in $Q$ and $A \subseteq \mathbb{A}$. Then:

1. clean $(Q\{R / x\}, A)=\operatorname{clean}(Q, A)\{R / x\}$;
2. unmark $(Q\{R / x\})=\operatorname{unmark}(Q)\{R / x\}$.

Proof: We prove only Item 1 by induction on $Q$ (Item 2 can be proved similarly).
Nil: $Q=$ nil. Trivially clean $(\operatorname{nil}\{R / x\}, A)=\operatorname{clean}($ nil,$A)=$ nil
Var: $Q=y$. In this case $x$ action-guarded in $Q$ implies $x \neq y$ and $Q\{R / x\}=y$. Similar to the previous case.

Pref: $Q=\alpha . P_{1}$ or $Q=\underline{\alpha} \cdot P_{1}$. We prove only the latter case (the former is simpler). In this case, $x$ is action-guarded in $Q$ and $Q\{R / x\}=\underline{\alpha} \cdot\left(P_{1}\{R / x\}\right)$. Assume $\alpha \in A$. Then clean $(Q\{R / x\}, A)=\alpha \cdot\left(P_{1}\{R / x\}\right)=\left(\alpha . P_{1}\right)\{R / x\}=\operatorname{clean}(Q, A)\{R / x\}$. Similarly if $\alpha \notin A$ then clean $(Q\{R / x\}, A)=\underline{\alpha} \cdot\left(P_{1}\{R / x\}\right)=\left(\underline{\alpha} \cdot P_{1}\right)\{R / x\}=\operatorname{clean}(Q, A)\{R / x\}$.

Read: $Q=\mu \triangleright Q_{1}$. In this case $x$ is action-guarded in $Q$ if it is so in $Q_{1}$. Moreover $Q\{R / x\}=$ $\mu \triangleright\left(Q_{1}\{R / x\}\right)$. Let us first consider the case where $\mu=\underline{\alpha}$ and $\alpha \in A$. Then, by Definition 2.3 and induction hypothesis it is clean $(Q\{R / x\}, A)=\alpha \triangleright \operatorname{clean}\left(Q_{1}\{R / x\}, A\right)=$ $\alpha \triangleright\left(\operatorname{clean}\left(Q_{1}, A\right)\{R / x\}\right)=\left(\alpha \triangleright \operatorname{clean}\left(Q_{1}, A\right)\{R / x\}\right)=\operatorname{clean}(Q, A)\{R / x\}$. If either $\mu=\underline{\alpha}$ and $\alpha \notin A$ or $\mu=\alpha$ then, similarly, clean $(Q\{R / x\}, A)=\mu \triangleright \operatorname{clean}\left(Q_{1}\{R / x\}, A\right)=\mu \triangleright$ $\left(\operatorname{clean}\left(Q_{1}, A\right)\{R / x\}\right)=\left(\mu \triangleright \operatorname{clean}\left(Q_{1}, A\right)\{R / x\}\right)=\operatorname{clean}(Q, A)\{R / x\}$.

Sum: $Q=Q_{1}+Q_{2}$. In such a case $x$ is action-guarded in $Q$ iff it is action-guarded in $Q_{1}$ and in $Q_{2}$. Moreover, clean $(Q\{R / x\}, A)=\operatorname{clean}\left(Q_{1}\{R / x\}+Q_{2}\{R / x\}, A\right)=\operatorname{clean}\left(Q_{1}\{R / x\}, A\right)+$ clean $\left(Q_{2}\{R / x\}, A\right)=($ by induction hypothesis $)\left(\right.$ clean $\left.\left(Q_{1}, A\right)\{R / x\}\right)+\left(\operatorname{clean}\left(Q_{2}, A\right)\{R / x\}\right)=$ $\left(\operatorname{clean}\left(Q_{1}, A\right)+\operatorname{clean}\left(Q_{2}, A\right)\right)\{R / x\}=\operatorname{clean}(Q, A)\{R / x\}$.

Par: $Q=Q_{1} \|_{B} Q_{2}$. Assume $x$ action-guarded in $Q$ and, hence, in $Q_{1}$ and in $Q_{2}$. Let us denote with $A_{1}=B \backslash \mathcal{U}\left(Q_{2}\{R / x\}\right)$ and with $A_{2}=B \backslash \mathcal{U}\left(Q_{1}\{R / x\}\right)$. Then $x$ action-guarded in $Q_{1}, Q_{2}$ and Proposition A. 2 imply $A_{1}=B \backslash \mathcal{U}\left(Q_{2}\right)$ and $A_{2}=B \backslash \mathcal{U}\left(Q_{1}\right)$. By induction hypothesis we have that clean $(Q\{R / x\}, A)=\operatorname{clean}\left(Q_{1}\{R / x\}, A \cup A_{1}\right) \|_{B}$ clean $\left(Q_{2}\{R / x\}, A \cup A_{2}\right)=$ $\left(\operatorname{clean}\left(Q_{1}, A \cup A_{1}\right)\{R / x\}\right) \|_{B}\left(\operatorname{clean}\left(Q_{2}, A \cup A_{2}\right)\{R / x\}\right)=$
$\left(\operatorname{clean}\left(Q_{1}, A \cup A_{1}\right) \|_{B}\left(\operatorname{clean}\left(Q_{2}, A \cup A_{2}\right)\right)\{R / x\}=\operatorname{clean}(Q, A)\{R / x\}\right.$
Rel: $Q=Q_{1}\left[\Phi_{u}\right]$. Assume $x$ action-guarded in $Q$ and, hence, in $Q_{1}$. By induction hypothesis clean $(Q\{R / x\}, A)=\operatorname{clean}\left(\left(Q_{1}\{R / x\}\right)[\Phi], A\right)=\operatorname{clean}\left(Q_{1}\{R / x\}, \Phi^{-1}(A)\right)[\Phi]=$ $\left(\right.$ clean $\left.\left(Q_{1}, \Phi^{-1}(A)\right)\{R / x\}\right)[\Phi]=\left(\operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right)[\Phi]\right)\{R / x\}=\operatorname{clean}(Q, A)\{R / x\}$.

Rec: $Q=$ rec $y . Q_{1}$. If $x=y$ then $x$ is action-guarded in $Q, Q\{R / x\}=R$ and the statement follows easily. Now assume $x \neq y$. In this case $x$ is action-guarded if it is action-guarded in $Q_{1}$ and $Q\{R / x\}=$ rec $y \cdot\left(Q_{1}\{R / x\}\right)$. Finally, clean $(Q\{R / x\}, A)=$ rec $y . \operatorname{clean}\left(Q_{1}\{R / x\}, A\right)$ $=\operatorname{rec} y \cdot\left(\operatorname{clean}\left(Q_{1}, A\right)\{R / x\}\right)=\left(\operatorname{rec} y \cdot \operatorname{clean}\left(Q_{1}, A\right)\right)\{R / x\}=\operatorname{clean}(Q, A)\{R / x\}$, by induction hypothesis.

Proposition A. 8 Let $Q, Q^{\prime} \in \tilde{\mathbb{P}}$ and $X \subseteq \mathbb{A}$ such that $Q \xrightarrow{X}_{r} Q^{\prime}$. Then:

1. $\mathcal{A}\left(Q^{\prime}, A\right)=\mathcal{U}\left(Q^{\prime}, A\right)=\mathcal{A}(Q, A)$ for every $A \subseteq \mathbb{A}_{\tau} ;$
2. unmark $(Q)=\operatorname{unmark}\left(Q^{\prime}\right)$;
3. $Q=P \in \tilde{\mathbb{P}}_{1}$ implies unmark $\left(Q^{\prime}\right)=P$.

Proof: First, we prove, by induction on $Q \in \tilde{\mathbb{P}}$, Items 1 and 2 .
Var: $Q=x$. This case is not possible since $Q \xrightarrow{\not X}{ }_{r}$.
Nil: $Q=$ nil. $Q \xrightarrow{X}_{r}$ nil $=Q^{\prime}$. In this case:

1. $\mathcal{A}\left(Q^{\prime}, A\right)=\mathcal{U}\left(Q^{\prime}, A\right)=\mathcal{A}(Q, A)=\emptyset$;
2. unmark $(Q)=\operatorname{unmark}\left(Q^{\prime}\right)=\operatorname{nil}$.

Pref: $Q=\alpha . P_{1}$ or $Q=\underline{\alpha} \cdot P_{1}$. In both cases $Q \xrightarrow{X} \underline{\alpha} \cdot P_{1}=Q^{\prime}$.

1. $\alpha \notin A$ implies $\mathcal{A}\left(Q^{\prime}, A\right)=\mathcal{U}\left(Q^{\prime}, A\right)=\mathcal{A}(Q, A)=\{\alpha\}$. Otherwise, $\mathcal{A}\left(Q^{\prime}, A\right)=$ $\mathcal{U}\left(Q^{\prime}, A\right)=\mathcal{A}(Q, A)=\emptyset$.
2. unmark $(Q)=\operatorname{unmark}\left(Q^{\prime}\right)=\alpha \cdot P_{1}$.

Read: $Q=\alpha \triangleright Q_{1}$ or $Q=\underline{\alpha} \triangleright Q_{1}$. In both cases $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ if $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$ and $Q^{\prime}=\underline{\alpha} \triangleright Q_{1}^{\prime}$. By induction hypothesis:

1. $\alpha \notin A$ implies $\mathcal{A}\left(Q^{\prime}, A\right)=\{\alpha\} \cup \mathcal{A}\left(Q_{1}^{\prime}, A\right)=\{\alpha\} \cup \mathcal{U}\left(Q_{1}^{\prime}, A\right)=\mathcal{U}\left(Q^{\prime}, A\right)=\{\alpha\} \cup$ $\mathcal{A}\left(Q_{1}, A\right)=\mathcal{A}(Q, A)$. Otherwise, $\mathcal{A}\left(Q^{\prime}, A\right)=\mathcal{A}\left(Q_{1}^{\prime}, A\right)=\mathcal{U}\left(Q_{1}, A\right)=\mathcal{U}\left(Q^{\prime}, A\right)=$ $\mathcal{A}\left(Q_{1}, A\right)=\mathcal{A}(Q, A)$.
2. unmark $(Q)=\alpha \triangleright \operatorname{unmark}\left(Q_{1}\right)=\alpha \triangleright \operatorname{unmark}\left(Q_{1}^{\prime}\right)=\operatorname{unmark}\left(Q^{\prime}\right)$.

Sum: $Q=Q_{1}+Q_{2}$. By operational semantics $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $Q_{1} \xrightarrow{X} r Q_{1}^{\prime}, Q_{2} \xrightarrow{X}{ }_{r} Q_{2}^{\prime}$ and $Q^{\prime}=Q_{1}^{\prime}+Q_{2}^{\prime}$. By induction hypothesis:

1. $\mathcal{A}\left(Q^{\prime}, A\right)=\mathcal{A}\left(Q_{1}^{\prime}, A\right) \cup \mathcal{A}\left(Q_{2}^{\prime}, A\right)=\mathcal{A}\left(Q_{1}, A\right) \cup \mathcal{A}\left(Q_{2}, A\right)=\mathcal{A}(Q, A)$. Similarly we can prove that $\mathcal{U}\left(Q^{\prime}, A\right)=\mathcal{A}(Q, A)$.
2. By induction hypothesis, we have that $\operatorname{unmark}(Q)=\operatorname{unmark}\left(Q_{1}\right)+\operatorname{unmark}\left(Q_{2}\right)=$ $\operatorname{unmark}\left(Q_{1}^{\prime}\right)+\operatorname{unmark}\left(Q_{2}^{\prime}\right)=\operatorname{unmark}\left(Q^{\prime}\right)$.

Par: $Q=Q_{1} \|_{B} Q_{2}$. Assume $Q \xrightarrow{X}{ }_{r} Q^{\prime}$. Then, by operational rules, $Q_{i} \xrightarrow{X_{i}}{ }_{r} Q_{i}^{\prime}$ for $i=1,2$ and $X \subseteq\left(B \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash B\right)$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}\right)$.

1. By induction hypothesis and Proposition A.6-3, it is $\mathcal{A}\left(Q^{\prime}, A\right)=\mathcal{A}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}, A\right)=$ $\mathcal{A}\left(Q_{1}^{\prime}, A \cup B\right) \cup \mathcal{A}\left(Q_{2}^{\prime}, A \cup B\right) \cup\left(\mathcal{A}\left(Q_{1}^{\prime}, A\right) \cap \mathcal{A}\left(Q_{2}^{\prime}, A\right) \cap B\right)=$ $\mathcal{A}\left(Q_{1}, A \cup B\right) \cup \mathcal{A}\left(Q_{2}, A \cup B\right) \cup\left(\mathcal{A}\left(Q_{1}, A\right) \cap \mathcal{A}\left(Q_{2}, A\right) \cap B\right)=\mathcal{A}(Q, A)$.
Similarly we can prove that $\mathcal{A}\left(Q^{\prime}, A\right)=\mathcal{U}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}, A\right)$. We are done since, by Proposition A.6-2, it is $\mathcal{U}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}, A\right)=\mathcal{U}\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}\right), A\right)=\mathcal{U}\left(Q^{\prime}, A\right)$.
2. By Proposition A.5-1 $\operatorname{unmark}\left(Q^{\prime}\right)=\operatorname{unmark}\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}\right)\right)=\operatorname{unmark}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}\right)$. Moreover, by inductuction hypothesis, unmark $\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}\right)=\operatorname{unmark}\left(Q_{1}^{\prime}\right) \|_{B}$ unmark $\left(Q_{2}^{\prime}\right)=$ $\operatorname{unmark}\left(Q_{1}\right) \|_{B} \operatorname{unmark}\left(Q_{2}\right)=\operatorname{unmark}(Q)$ and we are done.
Rel: $Q=Q_{1}[\Phi]$. By operational semantics $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $Q_{1} \xrightarrow{X^{\prime}}{ }_{r} Q_{1}^{\prime}$, with $X^{\prime}=\Phi^{-1}(X \cup$ $\{\tau\}) \backslash\{\tau\}$, and $Q^{\prime}=Q_{1}^{\prime}[\Phi]$. By induction hypothesis:
3. $\mathcal{A}\left(Q^{\prime}, A\right)=\Phi\left(\mathcal{A}\left(Q_{1}^{\prime}, \Phi^{-1}(A)\right)=\Phi\left(\mathcal{A}\left(Q_{1}, \Phi^{-1}(A)\right)=\mathcal{A}(Q, A)\right.\right.$. Similarly we can prove that $\mathcal{U}\left(Q^{\prime}, A\right)=\mathcal{A}(Q, A)$.
4. $\operatorname{unmark}(Q)=\operatorname{unmark}\left(Q_{1}\right)[\Phi]=\operatorname{unmark}\left(Q_{1}^{\prime}\right)[\Phi]=\operatorname{unmark}\left(Q^{\prime}\right)$.

Rec: $Q=\operatorname{rec} x \cdot Q_{1}$. By operational semantics $Q \xrightarrow{X} r Q^{\prime}$ implies $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$ and $Q^{\prime}=\operatorname{rec} x \cdot Q_{1}^{\prime}$. By induction hypothesis:

1. $\mathcal{A}\left(Q^{\prime}, A\right)=\mathcal{A}\left(Q_{1}^{\prime}, A\right)=\mathcal{A}\left(Q_{1}, A\right)=\mathcal{A}(Q, A)$. Similarly it is $\mathcal{U}\left(Q^{\prime}, A\right)=\mathcal{A}(Q, A)$.
2. unmark $(Q)=\operatorname{rec} x$.unmark $\left(Q_{1}\right)=\operatorname{rec} x$.unmark $\left(Q_{1}^{\prime}\right)=\operatorname{unmark}\left(Q^{\prime}\right)$.

Now we prove Item 3. Assume $Q=P \in \tilde{\mathbb{P}}_{1}$ and that $P \xrightarrow{X}_{r} Q^{\prime}$. Then Item 2 and Proposition A.5-2 imply unmark $\left(Q^{\prime}\right)=\operatorname{unmark}(P)=P$.

Proposition A. 9 Let $Q \in \tilde{\mathbb{P}}, A, A^{\prime} \subseteq \mathbb{A}$ with $A \subseteq A^{\prime}$. Then: clean $\left(\right.$ clean $\left.(Q, A), A^{\prime}\right)=\operatorname{clean}\left(Q, A^{\prime}\right)$.
Proof: By induction on $Q \in \tilde{\mathbb{P}}$.
Nil, Var: $Q=$ nil or $Q=x$. In both cases clean $\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{clean}\left(Q, A^{\prime}\right)=Q$.

Pref: $Q=\alpha \cdot P_{1}$ or $Q=\underline{\alpha} \cdot P_{1}$. We only prove the latter case (the former case can be proved as the in the Nil-case). If $\alpha \in A \subseteq A^{\prime}$ then clean $\left(\right.$ clean $\left.(Q, A), A^{\prime}\right)=\operatorname{clean}\left(Q, A^{\prime}\right)=\alpha . P_{1}$. Otherwise, if $\alpha \notin A$ then clean $(Q, A)=Q$ and the statement follows easily.

Read: $Q=\alpha \triangleright Q_{1}$ or $Q=\underline{\alpha} \triangleright Q_{1}$. We only prove the latter case (the former one is easier). If $\alpha \in A \subseteq A^{\prime}$ then, induction hypothesis, clean $\left(\right.$ clean $\left.(Q, A), A^{\prime}\right)=\operatorname{clean}\left(\alpha \triangleright\right.$ clean $\left.\left(Q_{1}, A\right), A^{\prime}\right)=$ $\alpha \triangleright$ clean $\left(\right.$ clean $\left.\left(Q_{1}, A\right), A^{\prime}\right)=\alpha \triangleright \operatorname{clean}\left(Q_{1}, A^{\prime}\right)=\operatorname{clean}\left(Q, A^{\prime}\right)$.
If $\alpha \notin A$, it is clean $\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{clean}\left(\underline{\alpha} \triangleright \operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)$. Now, $\alpha \in A^{\prime}$ implies clean $\left(\underline{\alpha} \triangleright \operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=\alpha \triangleright \operatorname{clean}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=\alpha \triangleright \operatorname{clean}\left(Q_{1}, A^{\prime}\right)=\operatorname{clean}\left(Q, A^{\prime}\right)$ by induction hypothesis. Finally, if $\alpha \notin A^{\prime}$ we have that clean $\left(\underline{\alpha} \triangleright \operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=\underline{\alpha} \triangleright$ clean $\left(\right.$ clean $\left.\left(Q_{1}, A\right), A^{\prime}\right)=\underline{\alpha} \triangleright \operatorname{clean}\left(Q_{1}, A^{\prime}\right)=\operatorname{clean}\left(Q, A^{\prime}\right)$, again by induction hypothesis.

Sum: $Q=Q_{1}+Q_{2}$. In this a case the statement follows easily by induction hypothesis.
Par: $Q=Q_{1} \|_{B} Q_{2}$. Let us denote with $A_{1}=\left(\mathcal{U}\left(Q_{1}\right) \backslash \mathcal{U}\left(Q_{2}\right)\right) \cap B \subseteq B \backslash \mathcal{U}\left(Q_{2}\right)$. Moreover, if $\alpha \in\left(B \backslash \mathcal{U}\left(Q_{2}\right)\right) \backslash A_{1}$ then $\alpha \notin \mathcal{U}\left(Q_{1}\right)$. Thus, $B \backslash \mathcal{U}\left(Q_{2}\right)=A_{1} \cup\left(\left(B \backslash \mathcal{U}\left(Q_{2}\right)\right) \backslash A_{1}\right)$ where $\left(\left(B \backslash \mathcal{U}\left(Q_{2}\right)\right) \backslash A_{1}\right) \cap \mathcal{U}\left(Q_{1}\right)=\emptyset$. Then, by proposition A.6-1., $Q_{1}^{\prime}=\operatorname{clean}\left(Q_{1}, A \cup A_{1}\right)=$ clean $\left(Q_{1}, A \cup A_{1} \cup\left(\left(B \backslash \mathcal{U}\left(Q_{2}\right)\right) \backslash A_{1}\right)\right)=\operatorname{clean}\left(Q_{1}, A \cup\left(B \backslash \mathcal{U}\left(Q_{2}\right)\right)\right)$. Similarly we can prove that $Q_{2}^{\prime}=\operatorname{clean}\left(Q_{2}, A \cup A_{2}\right)=\operatorname{clean}\left(Q_{1}, A \cup\left(B \backslash \mathcal{U}\left(Q_{1}\right)\right)\right)$ where $A_{2}=\left(\mathcal{U}\left(Q_{2}\right) \backslash \mathcal{U}\left(Q_{1}\right)\right) \cap B \subseteq$ $B \backslash \mathcal{U}\left(Q_{1}\right)$. By Definition 2.3, it is clean $(Q, A)=Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}$.
Now let $A_{1}^{\prime}=B \backslash \mathcal{U}\left(Q_{2}^{\prime}\right)$ and $A_{2}^{\prime}=B \backslash \mathcal{U}\left(Q_{1}^{\prime}\right)$ Since, by Propositions A.6-2. and A.1-4., $\mathcal{U}\left(Q_{1}^{\prime}\right)=\mathcal{U}\left(Q_{1}, A \cup A_{1}\right) \subseteq \mathcal{U}\left(Q_{1}\right)$ and $\mathcal{U}\left(Q_{2}^{\prime}\right)=\mathcal{U}\left(Q_{2}, A \cup A_{2}\right) \subseteq \mathcal{U}\left(Q_{2}\right)$, it is $A_{1} \subseteq B \backslash \mathcal{U}\left(Q_{2}\right) \subseteq$ $B \backslash \mathcal{U}\left(Q_{2}^{\prime}\right)=A_{1}^{\prime}$ and similarly $A_{2} \subseteq A_{2}^{\prime}$. Hence $A \cup A_{i} \subseteq A^{\prime} \cup A_{i}^{\prime}$ for $i=1,2$ and, by induction hypothesis, clean $\left(Q_{i}^{\prime}, A^{\prime} \cup A_{i}^{\prime}\right)=\operatorname{clean}\left(\operatorname{clean}\left(Q_{i}, A \cup A_{i}\right), A^{\prime} \cup A_{i}^{\prime}\right)=\operatorname{clean}\left(Q_{i}, A^{\prime} \cup A_{i}^{\prime}\right)$ for $i=1,2$. By Definition 2.3 we have that clean $\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}, A^{\prime}\right)=$ clean $\left(Q_{1}^{\prime}, A^{\prime} \cup A_{1}^{\prime}\right) \|_{B}$ clean $\left(Q_{2}^{\prime}, A^{\prime} \cup A_{2}^{\prime}\right)=\operatorname{clean}\left(Q_{1}, A^{\prime} \cup A_{1}^{\prime}\right) \|_{B}$ clean $\left(Q_{2}, A^{\prime} \cup A_{2}^{\prime}\right)$.
Due to the fact that (exactly as above) clean $\left(Q_{1}, A^{\prime} \cup A_{1}\right)=$ clean $\left(Q_{1}, A^{\prime} \cup\left(B \backslash \mathcal{U}\left(Q_{2}\right)\right)\right)$ and clean $\left(Q_{2}, A^{\prime} \cup A_{2}\right)=$ clean $\left(Q_{2}, A^{\prime} \cup\left(B \backslash \mathcal{U}\left(Q_{1}\right)\right)\right)$, again by By Definition 2.3, it still remains to prove that clean $\left(Q_{1}, A^{\prime} \cup A_{1}^{\prime}\right)=\operatorname{clean}\left(Q_{1}, A^{\prime} \cup A_{1}\right)$ and, similarly, that clean $\left(Q_{2}, A^{\prime} \cup A_{2}^{\prime}\right)=$ clean $\left(Q_{2}, A^{\prime} \cup A_{2}\right)$.
To this aim, let us consider a given $\alpha \in A_{1}^{\prime} \backslash A_{1} . \alpha \in A_{1}^{\prime}$ implies $\alpha \in B$ and $\alpha \notin \mathcal{U}\left(Q_{2}^{\prime}\right)$. So, $\alpha \in B$ and $\alpha \notin A_{1}$ implies either (1) $\alpha \notin \mathcal{U}\left(Q_{1}\right)$ or (2) both $\alpha \in \mathcal{U}\left(Q_{1}\right)$ and $\alpha \in \mathcal{U}\left(Q_{2}\right)$. In this latter case $\alpha \in \mathcal{U}\left(Q_{2}\right)$ and $\alpha \notin \mathcal{U}\left(Q_{2}^{\prime}\right)=\mathcal{U}\left(Q_{2}, A \cup A_{2}\right)=\mathcal{U}\left(Q_{2}\right) \backslash\left(A \cup A_{2}\right)$ implies $\alpha \in A \cup A_{2}$ and hence $\alpha \in A$ (this is because $\alpha \in \mathcal{U}\left(Q_{1}\right)$ and $\alpha \in \mathcal{U}\left(Q_{2}\right)$ implies $\left.\alpha \notin A_{2}\right)$.
Summing up, $\alpha \in A_{1}^{\prime} \backslash A_{1}$ implies either (1) $\alpha \notin \mathcal{U}\left(Q_{1}\right)$ or (2) $\alpha \in A$. As a consequence, $A_{1}^{\prime}=A_{1} \cup\left\{\alpha \in\left(A_{1}^{\prime} \backslash A_{1}\right) \mid \alpha \notin \mathcal{U}\left(Q_{1}\right)\right\} \cup\left\{\alpha \in\left(A_{1}^{\prime} \backslash A_{1}\right) \mid \alpha \in A\right\}$ and, since $A \subseteq A^{\prime}, A^{\prime} \cup A_{1}^{\prime}=$ $A^{\prime} \cup A_{1} \cup\left\{\alpha \in\left(A_{1}^{\prime} \backslash A_{1}\right) \mid \alpha \notin \mathcal{U}\left(Q_{1}\right)\right\}$. Finally, since all actions in $\left\{\alpha \in\left(A_{1}^{\prime} \backslash A_{1}\right) \mid \alpha \notin \mathcal{U}\left(Q_{1}\right)\right\}$ are sure not urgent in $Q_{1}$, again by Proposition A.6-2, we can conclude that clean $\left(Q_{1}, A^{\prime} \cup\right.$ $\left.A_{1}\right)=\operatorname{clean}\left(Q_{1}, A^{\prime} \cup A_{1}^{\prime}\right)$. With similar arguments we can prove that clean $\left(Q_{2}, A^{\prime} \cup A_{2}\right)=$ clean $\left(Q_{2}, A^{\prime} \cup A_{2}^{\prime}\right)$ and, hence, we are done.
Rel: $Q=Q_{1}[\Phi]$. In this case we have that clean $(Q, A)=\operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right)[\Phi]=Q_{1}^{\prime}[\Phi]$ and clean $\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{clean}\left(Q_{1}^{\prime}[\Phi], A^{\prime}\right)=\operatorname{clean}\left(Q_{1}^{\prime}, \Phi^{-1}\left(A^{\prime}\right)\right)[\Phi]$. Since $A \subseteq A^{\prime}$ implies $\Phi^{-1}(A) \subseteq \Phi^{-1}\left(A^{\prime}\right)$, by induction hypothesis it is clean $\left(Q_{1}^{\prime}, \Phi^{-1}\left(A^{\prime}\right)\right)=\operatorname{clean}\left(Q_{1}, \Phi^{-1}\left(A^{\prime}\right)\right)$. Finally clean $\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{clean}\left(Q_{1}, \Phi^{-1}\left(A^{\prime}\right)[\Phi]=\operatorname{clean}\left(Q, A^{\prime}\right)\right.$.

Rec: $Q=\operatorname{rec} x \cdot Q_{1}$. By induction hypothesis clean $\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=\operatorname{clean}\left(Q_{1}, A^{\prime}\right)$. Thus it is also clean $\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{rec} x$. clean $\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=\operatorname{rec} x . \operatorname{clean}\left(Q_{1}, A^{\prime}\right)=\operatorname{clean}\left(Q, A^{\prime}\right)$.

Proposition A. 10 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}}), A \subseteq \mathbb{A}$ and $A^{\prime} \subseteq \mathbb{A}_{\tau}$. Then:

1. $\operatorname{LE}\left(\right.$ clean $\left.(Q, A), A^{\prime}\right)=\operatorname{LE}\left(Q, A^{\prime}\right) ;$
2. $A \subseteq A^{\prime}$ implies $\operatorname{UE}\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\mathrm{UE}\left(Q, A^{\prime}\right)$.

Proof: We prove, by induction on $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$, only the Items 2 and 3 . Item 1 follows directly since cleaning inactive urgencies cannot affect the set of live events of a term $Q$ (see Definitions 2.3 and 5.7 for more details).

Nil, Var: $Q=$ nil $_{u}, Q=x_{u}$. In these cases $\operatorname{UE}\left(\right.$ clean $\left.(Q, A), A^{\prime}\right)=\operatorname{UE}\left(Q, A^{\prime}\right)=\emptyset$.
Pref: $Q=\alpha_{u} \cdot P_{1}$ or $Q=\underline{\alpha}_{u} \cdot P_{1}$. We prove only the latter case (the former is similar to the previous cases). Consider the following cases:

- $\alpha \in A \subseteq A^{\prime} . \operatorname{UE}\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{UE}\left(\alpha_{u} \cdot P_{1}, A^{\prime}\right)=\emptyset=\mathrm{UE}\left(Q, A^{\prime}\right)$.
- $\alpha \notin A$. In this case clean $(Q, A)=Q$ and the statement follows easily.

Read: $Q=\alpha_{u 1} \triangleright_{u} Q_{1}$ or $Q=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}$. We prove only the latter case (the former one can be proved similarly). Consider the following cases:

- $\alpha \in A \subseteq A^{\prime} . \operatorname{UE}\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\mathrm{UE}\left(\alpha_{u 1} \triangleright_{u}\right.$ clean $\left.\left(Q_{1}, A\right), A^{\prime}\right)=\mathrm{UE}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=$ (by induction hypothesis) $\mathrm{UE}\left(Q_{1}, A^{\prime}\right)=\mathrm{UE}\left(\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}, A^{\prime}\right)=\mathrm{UE}\left(Q, A^{\prime}\right)$.
- $\alpha \notin A$ and $\alpha \notin A^{\prime}$. In this case, $\operatorname{UE}\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{UE}\left(\underline{\alpha}_{u 1} \triangleright_{u}\right.$ clean $\left.\left(Q_{1}, A\right), A^{\prime}\right)=$ $\{\langle u 1\rangle\} \cup \mathrm{UE}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=($ by induction hypothesis $)\{\langle u 1\rangle\} \cup \mathrm{UE}\left(Q_{1}, A^{\prime}\right)=$ (since $\left.\alpha \notin A^{\prime}\right) \mathrm{UE}\left(\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}, A^{\prime}\right)=\mathrm{UE}\left(Q, A^{\prime}\right)$.
- $\alpha \notin A$ and $\alpha \in A^{\prime}$ can be proved as the former case.

Sum: $Q=Q_{1}+{ }_{u} Q_{2}$. Then, by induction hypothesis, $\operatorname{UE}\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{UE}\left(\operatorname{clean}\left(Q_{1}, A\right)+{ }_{u}\right.$ clean $\left.\left(Q_{2}, A\right), A^{\prime}\right)=\mathrm{UE}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right) \cup \mathrm{UE}\left(\operatorname{clean}\left(Q_{2}, A\right), A^{\prime}\right)=\mathrm{UE}\left(Q_{1}, A^{\prime}\right) \cup \mathrm{UE}\left(Q_{2}, A^{\prime}\right)=$ $\mathrm{UE}\left(Q, A^{\prime}\right)$.

Par: $Q=Q_{1} \|_{B}^{u} Q_{2}$. Let $A_{1}=B \backslash \mathcal{U}\left(Q_{2}\right), A_{2}=B \backslash \mathcal{U}\left(Q_{1}\right)$ and $R_{i}=\operatorname{clean}\left(Q_{i}, A \cup A_{i}\right)$ for $i=1,2$. By Definitions 2.3 and 5.8, we have that clean $(Q, A)=R_{1} \|_{B}^{u} R_{2}=R$ and $\operatorname{UE}\left(R, A^{\prime}\right)=$ $\mathrm{UE}\left(R_{1}, A^{\prime} \cup B\right) \cup \mathrm{UE}\left(R_{2}, A^{\prime} \cup B\right) \cup\left(\cup_{\alpha \in\left(B \backslash A^{\prime}\right)} R_{\alpha}\right)$ where, for each $\alpha \in B \backslash A^{\prime}$, we denote with $R_{\alpha}=\mathrm{UE}\left(R_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \mathrm{UE}\left(R_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$. In the following, given $\alpha \in B \backslash A^{\prime}$, we use $Q_{\alpha}$ to denote the set $\operatorname{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$. Since $A \cup A_{i} \subseteq A^{\prime} \cup B$, then by induction hypothesis it is $\mathrm{UE}\left(R_{i}, A^{\prime} \cup B\right)=\mathrm{UE}\left(\operatorname{clean}\left(Q_{i}, A \cup A_{i}\right), A^{\prime} \cup B\right)=\mathrm{UE}\left(Q_{i}, A^{\prime} \cup B\right)$, for $i=1,2$. Thus, again due to Definition 5.8, to prove our statement it still remains to prove that $\cup_{\alpha \in\left(B \backslash A^{\prime}\right)} R_{\alpha}=\cup_{\alpha \in\left(B \backslash A^{\prime}\right)} Q_{\alpha}$. Let $\alpha \in B \backslash A^{\prime}$ and consider the following possible subcases:

- $\alpha \in A_{1}=B \backslash \mathcal{U}\left(Q_{2}\right)$. In this case $\alpha \notin \mathcal{U}\left(Q_{2}\right)$ and $\mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \subseteq \mathcal{U}\left(Q_{2}\right)$ (see Proposition A.1-3) implies $\alpha \notin \mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$. Moreover, if there exists some $\beta$ such that $\beta \in \mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ then, by Proposition A.1-1, it is $\beta \notin \mathbb{A}_{\tau} \backslash\{\alpha\}$ and, hence, $\beta=\alpha$. We can conclude that $\mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$ and hence (see Proposition 5.11-3) $\operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$. Thus $Q_{\alpha}=\operatorname{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$.
Moreover, since $\mathcal{U}\left(R_{2}\right)=\mathcal{U}\left(\right.$ clean $\left.\left(Q_{2}, A \cup A_{2}\right)\right)=\mathcal{U}\left(Q_{2}, A \cup A_{2}\right) \subseteq \mathcal{U}\left(Q_{2}\right)$ (see Propositions A.6-2 and A.1-3) it is also $\alpha \notin \mathcal{U}\left(R_{2}\right)$. As above we have that $\mathcal{U}\left(R_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$, $\operatorname{UE}\left(R_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$ and $R_{\alpha}=\operatorname{UE}\left(R_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \mathrm{UE}\left(R_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$.
- $\alpha \in A_{2}$. As in the previous case we can prove that $Q_{\alpha}=R_{\alpha}=\emptyset$.
- $\alpha \notin A_{1}$ and $\alpha \notin A_{2}$. In this case $\alpha \in B \backslash A^{\prime}$ implies $\alpha \notin A \subseteq A^{\prime}$ and, hence, $\alpha \notin A \cup A_{i}$ for $i=1,2$. Thus $A \cup A_{i} \subseteq \mathbb{A}_{\tau} \backslash\{\alpha\}$ and, by induction hypothesis, $\operatorname{UE}\left(R_{i}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=$ $\operatorname{UE}\left(Q_{i}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$, for $i=1,2$. Hence $R_{\alpha}=Q_{\alpha}$.

This allows us to conclude that $\cup_{\alpha \in B \backslash A^{\prime}} R_{\alpha}=\cup_{\alpha \in B \backslash A^{\prime}} Q_{\alpha}$ and, hence, we are done.
Rel: $Q=Q_{1}\left[\Phi_{u}\right]$. Let us assume $A \subseteq A^{\prime}$ and, hence, $\Phi^{-1}(A) \subseteq \Phi^{-1}\left(A^{\prime}\right)$. By induction hypothesis $\mathrm{UE}\left(\operatorname{clean}(Q, A), A^{\prime}\right)=\operatorname{UE}\left(\operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right)\left[\Phi_{u}\right], A^{\prime}\right)=\operatorname{UE}\left(\operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right), \Phi^{-1}\left(A^{\prime}\right)\right)=$ $\operatorname{UE}\left(Q_{1}, \Phi^{-1}\left(A^{\prime}\right)\right)=\operatorname{UE}\left(Q, A^{\prime}\right)$.

Rec: $Q=\operatorname{rec} x_{u} . Q_{1}$. By induction hypothesis we have that $\operatorname{UE}\left(\operatorname{clean}(Q, A), A^{\prime}\right)=$
$\mathrm{UE}\left(\operatorname{rec} x_{u} . \operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=\mathrm{UE}\left(\operatorname{clean}\left(Q_{1}, A\right), A^{\prime}\right)=\operatorname{UE}\left(Q_{1}, A^{\prime}\right)=\mathrm{UE}\left(Q, A^{\prime}\right)$.

Lemma A. 11 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$. Then $\operatorname{UE}(\operatorname{clean}(Q), A)=\operatorname{UE}(Q, A)$ for every $A \subseteq \mathbb{A}_{\tau}$.
Proof: This follows directly from Proposition A.10-2

## B A Proof of Proposition 2.10

This section is devoted to proving Proposition 2.10.
Proposition 2.10 Let $Q, \in \tilde{\mathbb{P}}$ be a clean process. Then:

1. $Q \xrightarrow{\mu} Q^{\prime}$ and $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $Q^{\prime}$ clean;
2. $\mathcal{U}(Q)=\emptyset$ implies $Q \in \tilde{\mathbb{P}}_{1}$.

Proof: We first prove Item 2. By Proposition A.5-3., $\mathcal{U}(Q)=\emptyset$ implies $Q=\operatorname{clean}(Q)=\operatorname{unmark}(Q)$ and, hence $Q \in \tilde{\mathbb{P}}_{1}$.

Let us prove Item 1 . If $Q \stackrel{\mu}{\rightsquigarrow} Q^{\prime}$ then $Q^{\prime}=Q$ implies trivially $Q^{\prime}$ clean. So, it remains to prove our statement when (i) $Q \stackrel{\mu}{\mapsto} Q^{\prime}$ and (ii) $Q \xrightarrow{X} Q^{\prime}$. In the former case we proceed by induction on the derivation $Q \stackrel{\mu}{\mapsto} Q^{\prime}$, in the latter one by induction on $Q$.

Var: $Q=x$. This case is not possible since (i) $Q \nLeftarrow \nmid$ and (ii) $Q{\underset{\not{y}}{r}}_{r}$.
Nil: $Q=$ nil, $Q=x$. (i) $Q \not \psi^{\nmid}$ and (ii) $Q \xrightarrow{X}_{r}$ nil with nil clean.
Pref: $Q=\alpha . P_{1}$ or $Q=\underline{\alpha} . P_{1}$ with $P_{1} \in \tilde{\mathbb{P}}_{1}$. In both cases $Q$ is clean. Moreover:
(i) $Q \stackrel{\mu}{\rightarrow} Q^{\prime}$ implies $\mu=\alpha$ and $Q=P_{1} \in \tilde{\mathbb{P}}_{1}$ and, hence, clean.
(ii) $Q \xrightarrow{X} r \underline{\alpha} \cdot P_{1}=Q^{\prime}$ with clean $\left(\underline{\alpha} \cdot P_{1}\right)=\underline{\alpha} \cdot P_{1}$ and, hence $Q^{\prime}$ clean.

We only prove the latter case (since the former one follows easily). Assume $\mathcal{U}(Q, A)=\emptyset$. Then, by Definition 2.2, we have $\alpha \in A$ and hence clean $(Q, A)=\alpha \cdot P_{1}=\operatorname{unmark}(Q)$.

Read: $Q=\alpha \triangleright Q_{1}$ or $Q=\underline{\alpha} \triangleright Q_{1}$. In both cases $Q$ clean implies $Q_{1}$ clean.
(i) $Q \stackrel{\mu}{\mapsto} Q^{\prime}$ implies $Q_{1} \stackrel{\mu}{\mapsto} Q^{\prime}$ and the statement follows by induction hypothesis.
(ii) $Q \xrightarrow{X} \underset{r}{\alpha} \triangleright Q_{1}^{\prime}=Q^{\prime}$ if $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$. By induction hypothesis clean $\left(Q^{\prime}\right)=\underline{\alpha} \triangleright$ clean $\left(Q_{1}^{\prime}\right)=$ $\underline{\alpha} \triangleright Q_{1}^{\prime}=Q^{\prime}$, that is $Q^{\prime}$ is clean.

Sum: $Q=Q_{1}+Q_{2}$. In this case if $Q$ is clean then both $Q_{1}$ and $Q_{2}$ are clean.
(i) $Q \stackrel{\mu}{\mapsto} Q^{\prime}$ if either $Q_{1} \stackrel{\mu}{\mapsto} Q^{\prime}$ or $Q_{2} \stackrel{\mu}{\mapsto} Q^{\prime}$. In both cases, the statement follows by induction hypothesis.
(ii) $Q \xrightarrow{X}{ }_{r} Q_{1}^{\prime}+Q_{2}^{\prime}=Q^{\prime}$ if $Q_{i} \xrightarrow{X}{ }_{r} Q_{i}^{\prime}$ for $i=1,2$. By induction hypothesis $Q_{1}^{\prime}$ and $Q_{2}$ are clean. Thus, clean $\left(Q^{\prime}\right)=\operatorname{clean}\left(Q_{1}^{\prime}\right)+\operatorname{clean}\left(Q_{2}^{\prime}\right)=Q_{1}^{\prime}+Q_{2}^{\prime}=Q^{\prime}$. Again $Q^{\prime}$ is clean.
 $R$ such that $Q^{\prime}=\operatorname{clean}(R)$. By Proposition A.9, clean $\left(Q^{\prime}\right)=\operatorname{clean}(\operatorname{clean}(R))=\operatorname{clean}(R)=Q^{\prime}$. Also in this case $Q^{\prime}$ is clean.

Rel: $Q=Q_{1}[\Phi]$. Similar to the Read-case
Rec: $Q=$ rec $x . Q_{1}$. Again $Q$ clean implies $Q_{1}$ clean.
(i) Let $P_{1}=\operatorname{unmark}\left(Q_{1}\right), P=\operatorname{rec} x \cdot P_{1}$ and $S=Q_{1}\{P / x\} . x$ action-guarded in $Q_{1}$ and $Q_{1}$ clean implies clean $(S)=\operatorname{clean}\left(Q_{1}\right)\{P / x\}=Q_{1}\{P / x\}=S$ (see Proposition A.7-1.). By operational rules, $Q \stackrel{\mu}{\longrightarrow} Q^{\prime}$ if $S \stackrel{\mu}{\xrightarrow{\prime}} Q^{\prime}$ and, since $S$ is clean, the statement follows by induction hypothesis.
(ii) $Q \xrightarrow{X}{ }_{r}$ rec $x . Q_{1}^{\prime}=Q^{\prime}$ if $Q_{1} \xrightarrow{X}_{r} Q_{1}^{\prime}$. By induction hypothesis $Q_{1}^{\prime}$ is clean. Thus, clean $\left(Q^{\prime}\right)=\operatorname{rec} x$.clean $\left(Q_{1}^{\prime}\right)=$ rec $x . Q_{1}^{\prime}=Q^{\prime}$. Again $Q^{\prime}$ is clean.

## C Proofs of Proposition 4.2 and Theorem 4.3

As usual, some preliminary results are needed.
Proposition C. $1 \llbracket Q \rrbracket \nsim$ for all read-guarded $Q \in \tilde{\mathbb{S}}$.
Proof: By induction on $Q \in \tilde{\mathbb{S}}$
Nil, Var, Pref: $Q=$ nil, $Q=x$ or $Q=\mu . P$. By Definition 4.1, it is $\llbracket Q \rrbracket=$ nil, $\llbracket Q \rrbracket=x$ or $\llbracket Q \rrbracket=\mu . \llbracket P \rrbracket$. In all of such cases $\llbracket Q \rrbracket \not \mathcal{*}^{*}$.

Read: $Q=\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}$. This case is not possible since $Q$ is not read-guarded.
Sum: $Q=Q_{1}+Q_{2}$ with both $Q_{1}$ and $Q_{2}$ read-guarded. By induction hypothesis, $\llbracket Q_{1} \rrbracket \nsim \nsim$ and $\llbracket Q_{2} \rrbracket \not \mathscr{*}$. Thus, by operational rules, $\llbracket Q \rrbracket=\llbracket Q_{1} \rrbracket+\llbracket Q_{2} \rrbracket \not \approx$ 。

Par: $Q=Q_{1} \|_{B} Q_{2}$ with both $Q_{1}$ and $Q_{2}$ read-guarded. The statement follows easily by induction hypothesis as in the previous case.

Rel: $Q=Q_{1}[\Phi]$ with $Q_{1}$ read-guarded. By induction hypothesis, $\llbracket Q_{1} \rrbracket \nsim \nsim$. By operational rules we can conclude that $\llbracket Q \rrbracket \not \overbrace{*}^{q}$.

Rec: Similar to the previous case.

Proposition C. 2 Let $Q, R \in \tilde{\mathbb{S}}$ and $x \in \mathcal{X}$ action-guarded in $Q$. If $Q$ is read-guarded, then so is $Q\{R / x\}$.

Proof: By induction on $Q \in \tilde{\mathbb{S}}$.
Nil: $Q=$ nil. Then $Q=Q\{R / x\}=$ nil is read-guarded.
Var: $Q=y$. If $x$ is action-guarded in $Q$, then $x \neq y$ and $Q\{R / x\}=y$ is trivially read-guarded.
Pref: $Q=\mu \cdot P$. In this case it is $Q\{R / x\}=\mu \cdot(P\{R / x\})$ and, hence, read-guarded.
Read: $Q=\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}$. This case is not possible, since $Q$ is not read-guarded.
Sum: $Q=Q_{1}+Q_{2}$ with $Q_{i}$ read-guarded and $x$ action-guarded in $Q_{i}$, for $i=1,2$. By induction hypothesis, $Q_{1}\{R / x\}$ and $Q_{2}\{R / x\}$ are read-guarded. Hence, $Q\{R / x\}=Q_{1}\{R / x\}+Q_{2}\{R / x\}$ is read-guarded.

Par: $Q=Q_{1} \|_{B} Q_{2}$ with $Q_{i}$ read-guarded and $x$ action-guarded in $Q_{i}$, for $i=1,2$. The statement follows by induction hypothesis as in the previous case.

Rel: $Q=Q_{1}[\Phi]$ with $Q_{1}$ read-guarded and $x$ action-guarded in $Q_{1}$. By induction hypothesis, $Q_{1}\{R / x\}$ and hence $Q\{R / x\}=\left(Q_{1}\{R / x\}\right)[\Phi]$ is read-guarded.

Rec: $Q=$ rec $y . Q_{1}$ with $Q_{1}$ read-guarded and $x$ action-guarded in $Q_{1}$. We consider two subcases:

- $x=y$. In this case $Q\{R / x\}=Q$ is read-guarded.
- $x \neq y$. By induction hypothesis we have $Q_{1}\{R / x\}$ and hence $Q\{R / x\}=$ rec $y \cdot Q_{1}\{R / x\}$ read-guarded.

Proposition C. 3 Let $Q^{\prime}$ be a subterm of $Q \in \tilde{\mathbb{S}}$. If $Q$ is read-proper, then so is $Q^{\prime}$; if $x$ is read-guarded in $Q$, then it is also read-guarded in $Q^{\prime}$.

Proof: It can be easily proven by induction on $Q \in \tilde{\mathbb{S}}$.

Proposition C. 4 Let $Q, R \in \tilde{\mathbb{S}}$ be read-proper and $x \in \mathcal{X}$ be read-guarded in $Q$. Then: $Q\{R / x\}$ is read-proper.

Proof: By induction on $Q \in \tilde{\mathbb{S}}$. We repeatedly apply Proposition C. 3 in the following without mentioning this explicitly.

Nil: $Q=$ nil. $Q\{R / x\}=Q=$ nil and the statement follows easily.
Var: $Q=y$. If $x \neq y$ then $Q\{R / x\}=y$. If $x=y$ then $Q\{R / x\}=R$. In both cases $Q\{R / x\}$ is read-proper.

Pref: $Q=\mu . P$ with $P$ read-proper and $x$ read-guarded in $P$. By induction hypothesis, we have $P\{R / x\}$ and $Q\{R / x\}=\mu \cdot(P\{R / x\})$ read-proper.

Read: $Q=\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}$ with $Q_{1}$ both read-guarded and read-proper. In this case, $x$ readguarded in $Q$ implies that $x$ is both action-guarded and read-guarded in $Q_{1}$. By induction hypothesis, $Q_{1}, R$ read-proper and $x$ read-guarded in $Q_{1}$ implies $Q_{1}\{R / x\}$ read-proper. Moreover, $Q_{1}$ read-guarded and $x$ action-guarded in $Q_{1}$ implies $Q_{1}\{R / x\}$ read-guarded (by Proposition C.2). By definition of read-properness we can conclude that $Q\{R / x\}$ is both read-guarded and read-proper.

Sum: $Q=Q_{1}+Q_{2}$ with $Q_{1}, Q_{2}$ read-proper and $x$ read-guarded in $Q_{1}$ and in $Q_{2}$. By induction hypothesis, it is $Q_{1}\{R / x\}, Q_{2}\{R / x\}$ read-proper. Hence $Q\{R / x\}=Q_{1}\{R / x\}+Q_{2}\{R / x\}$ is read-proper.

Par: $Q=Q_{1} \|_{B} Q_{2}$ with $Q_{1}, Q_{2}$ read-proper and $x$ read-guarded in $Q_{1}$ and in $Q_{2}$. The statement follows by induction hypothesis as in the previous case.

Rel: $Q=Q_{1}[\Phi]$ with $Q_{1}$ read-proper and $x$ read-guarded in $Q_{1}$. By induction hypothesis, we have $Q\{R / x\}=\left(Q_{1}\{R / x\}\right)[\Phi]$ read-proper.

Rec: $Q=$ rec $y . Q_{1}$ with $Q_{1}$ read-proper and $x$ read-guarded in $Q_{1}$. We distinguish two possible subcases. If $x=y$ then $Q\{R / x\}=Q$ which is trivially read-proper. Otherwise, if $x \neq y$, then $Q\{R / x\}=\operatorname{rec} y \cdot\left(Q_{1}\{R / x\}\right)$ with $Q_{1}\{R / x\}$ read-proper by induction hypothesis. Again, we can conclude that $Q\{R / x\}$ is read-proper.

Proposition C. 5 Let $Q \in \tilde{\mathbb{S}}$ and $A \subseteq \mathbb{A}$. Then:

1. $\mathcal{U}(\llbracket Q \rrbracket, A)=\mathcal{U}(Q, A)$;
2. unmark $(\llbracket Q \rrbracket)=\llbracket u n m a r k(Q) \rrbracket ;$
3. clean $(\llbracket Q \rrbracket, A)=\llbracket \operatorname{clean}(Q, A) \rrbracket$.

Proof: Item 1 follows easily by Definitions $2.2,3.2$ and 4.1. The proof of Item 2 is similar to that of Item 3 . So, we only prove the latter item by induction on $Q \in \tilde{\mathbb{S}}$.

Nil, Var: $Q=$ nil or $Q=x$. In both cases, clean $(\llbracket Q \rrbracket, A)=\llbracket \operatorname{clean}(Q, A) \rrbracket=Q$.
Pref: $Q=\alpha . P$ or $Q=\underline{\alpha} . P$. We prove only the latter case (the former one is easier). Consider the following possible cases:
$-\alpha \in A . \operatorname{clean}(\llbracket Q \rrbracket, A)=\operatorname{clean}(\underline{\alpha} \cdot \llbracket P \rrbracket, A)=\alpha \cdot \llbracket P \rrbracket=\llbracket \alpha \cdot P \rrbracket=\llbracket \operatorname{clean}(\underline{\alpha} \cdot P, A) \rrbracket$.
$-\alpha \notin A . \operatorname{clean}(\llbracket Q \rrbracket, A)=\operatorname{clean}(\underline{\alpha} \cdot \llbracket P \rrbracket, A)=\underline{\alpha} \cdot \llbracket P \rrbracket=\llbracket \underline{\alpha} \cdot P \rrbracket=\llbracket \operatorname{clean}(\underline{\alpha} \cdot P, A) \rrbracket$.
Read: $Q=\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}$. Let $\left\{\nu_{1}, \ldots, \nu_{n}\right\}$ the subset of $\mathbb{A}_{\tau} \cup \mathbb{A}_{\tau}$ such that for each $i \in[1, n]$, $\nu_{i}=\alpha$ if $\mu=\underline{\alpha}$ and $\alpha \in A ; \nu_{i}=\mu_{i}$ otherwise. By Definition 4.1, it is clean $(\llbracket Q \rrbracket, A)=$ clean $\left(\mu_{1} \triangleright \ldots \triangleright \mu_{n} \triangleright \llbracket Q_{1} \rrbracket, A\right)=\nu_{1} \triangleright \ldots \triangleright \nu_{n} \triangleright$ clean $\left(\llbracket Q_{1} \rrbracket, A\right)=\nu_{1} \triangleright \ldots \triangleright \nu_{n} \triangleright \llbracket c l e a n\left(Q_{1}, A\right) \rrbracket$ (by induction hypothesis) $=\llbracket\left\{\nu_{1}, \ldots, \nu_{n}\right\} \triangleright \operatorname{clean}\left(Q_{1}, A\right) \rrbracket=\llbracket c l e a n(Q, A) \rrbracket$.

Sum: $Q=Q_{1}+Q_{2}$. By Definitions 3.3 and 4.1, we have that clean $(\llbracket Q \rrbracket, A)=\operatorname{clean}\left(\llbracket Q_{1} \rrbracket+\llbracket Q_{2} \rrbracket, A\right)=$ clean $\left(\llbracket Q_{1} \rrbracket, A\right)+\operatorname{clean}\left(\llbracket Q_{2} \rrbracket, A\right)$ By induction hypothesis it is clean $\left(\llbracket Q_{i} \rrbracket, A\right)=\llbracket \operatorname{clean}\left(Q_{i}, A\right) \rrbracket$, for $i=1,2$. Finally: clean $(\llbracket Q \rrbracket, A)=\operatorname{clean}\left(\llbracket Q_{1} \rrbracket, A\right)+\operatorname{clean}\left(\llbracket Q_{2} \rrbracket, A\right)=\llbracket \operatorname{clean}\left(Q_{1}, A\right) \rrbracket+$ $\llbracket \operatorname{clean}\left(Q_{2}, A\right) \rrbracket=\llbracket \operatorname{clean}\left(Q_{1}+Q_{2}, A\right) \rrbracket=\llbracket c \operatorname{clean}(Q, A) \rrbracket$.

Par: $Q=Q_{1} \|_{B} Q_{2}$. Let $A_{1}=B \backslash \mathcal{U}\left(\llbracket Q_{2} \rrbracket\right)=B \backslash \mathcal{U}\left(Q_{2}\right)$ and $A_{2}=B \backslash \mathcal{U}\left(\llbracket Q_{1} \rrbracket\right)=B \backslash \mathcal{U}\left(Q_{1}\right)$ by Item 1. By Definitions 3.3 and 4.1, we have that clean $(\llbracket Q \rrbracket, A)=\operatorname{clean}\left(\llbracket Q_{1} \rrbracket \|_{B} \llbracket Q_{2} \rrbracket, A\right)=$ clean $\left(\llbracket Q_{1} \rrbracket, A \cup A_{1}\right) \|_{B}$ clean $\left(\llbracket Q_{2} \rrbracket, A \cup A_{2}\right)=\llbracket \operatorname{clean}\left(Q_{1}, A \cup A_{1}\right) \rrbracket \|_{B} \llbracket \operatorname{clean}\left(Q_{2}, A \cup A_{2}\right) \rrbracket=$ $\llbracket \operatorname{clean}\left(Q_{1}, A \cup A_{1}\right) \|_{B}$ clean $\left(Q_{2}, A \cup A_{2}\right) \rrbracket=\llbracket$ clean $(Q, A) \rrbracket$ by induction hypothesis.

Rel: $Q=Q_{1}[\Phi]$. In this case, again by Definitions 3.3 and 4.1, clean $(\llbracket Q \rrbracket, A)=\operatorname{clean}\left(\llbracket Q_{1} \rrbracket[\Phi], A\right)=$ clean $\left(\llbracket Q_{1} \rrbracket, \Phi^{-1}(A)\right)[\Phi]=\llbracket \operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right) \rrbracket[\Phi]=\llbracket \operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right)[\Phi \rrbracket \rrbracket=\llbracket \operatorname{clean}(Q, A) \rrbracket$.

Rec: $Q=$ rec $x . Q_{1}$. By induction hypothesis (and by Definitions 3.3 and 4.1 ), clean $(\llbracket Q \rrbracket, A)=$ clean $\left(\right.$ rec $\left.x . \llbracket Q_{1} \rrbracket, A\right)=\operatorname{rec} x . \operatorname{clean}\left(\llbracket Q_{1} \rrbracket, A\right)=\operatorname{rec} x . \llbracket \operatorname{clean}\left(Q_{1}, A\right) \rrbracket=\llbracket \operatorname{rec} x . \operatorname{clean}\left(Q_{1}, A\right) \rrbracket=$〔clean $(Q, A) \rrbracket$.

Proposition 4.2 Let $Q \in \tilde{\mathbb{S}}$ be read-proper and assume $Q \xrightarrow{\alpha} Q^{\prime}\left(Q \xrightarrow{X} r Q^{\prime}\right)$. Then $Q^{\prime}$ is readproper.
Proof: If $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ then unmark $(Q)=\operatorname{unmark}\left(Q^{\prime}\right)\left(Q^{\prime}\right.$ is $Q$ with all activated actions marked as urgent) and we are done since $Q$ read-proper implies $Q^{\prime}$ read-proper. We prove that if $Q \xrightarrow{\alpha} Q^{\prime}$ then $Q^{\prime}$ is read proper by induction on the length of the derivation $Q \xrightarrow{\alpha} Q^{\prime}$.

Nil, Var: $Q=$ nil or $Q=x$. These cases are not possible since $Q \xrightarrow{q}$ for any $\alpha$.
Pref: $Q=\mu \cdot P$ with $P$ read-proper. By the operational semantics, $Q \xrightarrow{\alpha} Q^{\prime}$ if $\mu \in\{\alpha, \underline{\alpha}\}$ and $Q=P$ (and, hence, read-proper).

Read: $Q=\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}$ with $Q_{1}$ read-proper. If $Q \xrightarrow{\alpha}\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q=Q^{\prime}$ because there exists some $\mu_{i} \in\{\alpha, \underline{\alpha}\}$, then trivially $Q^{\prime}$ is read-proper. Otherwise, $Q \xrightarrow{\alpha} Q^{\prime}$ because of $Q_{1} \xrightarrow{\alpha} Q^{\prime}$ and, by induction hypothesis, $Q^{\prime}$ read-proper.

Sum: $Q=Q_{1}+Q_{2}$ with $Q_{1}$ and $Q_{2}$ read-proper. In this case $Q \xrightarrow{\alpha} Q^{\prime}$ if either $Q_{1} \xrightarrow{\alpha} Q^{\prime}$ or $Q_{2} \xrightarrow{\alpha} Q^{\prime}$. In both cases, by induction hypothesis, $Q^{\prime}$ is read-proper.

Par: $Q=Q_{1} \|_{B} Q_{2}$ with $Q_{1}, Q_{2}$ read-proper. Assume $Q \xrightarrow{\alpha} Q^{\prime}$ and consider the following possible subcases:

- $\alpha \notin B, Q_{1} \xrightarrow{\alpha} Q_{1}^{\prime}$ and $Q^{\prime}=$ clean $\left(Q_{1}^{\prime} \|_{B} Q_{2}\right) . Q_{1}$ read-proper and $Q_{1} \xrightarrow{\alpha} Q_{1}^{\prime}$ implies by induction hypothesis $Q_{1}^{\prime}$ read-proper. Finally, $Q_{1}^{\prime}$ and $Q_{2}$ read-proper implies $Q_{1}^{\prime} \|_{B} Q_{2}$ and hence clean $\left(Q_{1}^{\prime} \|_{B} Q_{2}\right)$ read-proper (as above, we have that unmark $\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}\right)\right)=$ unmark $\left.\left(Q_{1}^{\prime} \|_{B} Q_{2}\right)\right)$.
- either $\alpha \notin B, Q_{2} \xrightarrow{\alpha} Q_{2}^{\prime}$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1} \|_{B} Q_{2}^{\prime}\right)$ or $\alpha \in B, Q_{i} \xrightarrow{\alpha} Q_{i}^{\prime}$ for $i=1,2$, and $Q^{\prime}=$ clean $\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}\right)$. These cases can be proven as the previous one.

Rel: $Q=Q_{1}[\Phi]$ with $Q_{1}$ read-proper. In this case, $Q \xrightarrow{\alpha} Q_{1}^{\prime}[\Phi]=Q^{\prime}$ if there exists $\beta \in \Phi^{-1}(\alpha)$ such that $Q_{1} \xrightarrow{\alpha} Q_{1}^{\prime}$. By induction hypothesis, $Q^{\prime}=Q_{1}^{\prime}[\Phi]$ is read-proper.

Rec: $Q=\operatorname{rec} x . Q_{1}$ with $Q_{1}$ read-proper. In this case $Q \xrightarrow{\alpha} Q^{\prime}$ if $Q\left\{\right.$ rec $x$.unmark $\left.\left(Q_{1}\right) / x\right\} \xrightarrow{\alpha} Q^{\prime}$. Moreover, $Q$ read-proper implies $Q_{1}$ and rec $x$.unmark $\left(Q_{1}\right)$ read-proper. Then, $x$ read-guarded in $Q_{1}$ and Proposition C. 4 imply $Q\left\{\right.$ rec $x$.unmark $\left.\left(Q_{1}\right) / x\right\}$ and (by induction hypothesis) $Q^{\prime}$ read-proper.

We subdivide Theorem 4.3 into the following two propositions, which we prove separately.
Proposition C. 6 For all read-proper $Q \in \tilde{\mathbb{S}}$ :

1. $Q \xrightarrow{\alpha} Q^{\prime}$ implies $\llbracket Q \rrbracket \xrightarrow{\alpha} \llbracket Q^{\prime} \rrbracket$;
2. $\llbracket Q \rrbracket \xrightarrow{\alpha} Q^{\prime \prime}$ implies $Q \xrightarrow{\alpha} Q^{\prime}$ with $\llbracket Q^{\prime} \rrbracket=Q^{\prime \prime}$.

Proof: We prove these statements by induction on the length of derivations $Q \xrightarrow{\alpha} Q^{\prime}$ and $\llbracket Q \rrbracket \xrightarrow{\alpha}$ $Q^{\prime \prime}$. We proceed by a case analysis on the structure of $Q$.

Nil, Var: $Q=\llbracket Q \rrbracket=$ nil or $Q=\llbracket Q \rrbracket=x$. Not possible since $Q \xrightarrow{q}$ for any $\alpha$.
Pref: $Q=\mu \cdot P$ and $\llbracket Q \rrbracket=\mu . \llbracket P \rrbracket$.

1. If $Q \xrightarrow{\alpha} Q^{\prime}$ then $\mu \in\{\alpha, \underline{\alpha}\}$ and $Q^{\prime}=P$. Moreover, $\llbracket Q \rrbracket=\mu \cdot \llbracket P \rrbracket \xrightarrow{\alpha} \llbracket P \rrbracket$.
2. Similar to the previous one.

Read: $Q=A \triangleright Q_{1}$ with $A=\left\{\mu_{1}, \ldots, \mu_{n}\right\}$. In this case $\llbracket Q \rrbracket=\mu_{1} \triangleright \ldots \triangleright \mu_{n} \triangleright \llbracket Q_{1} \rrbracket$.

1. If $Q \xrightarrow{\alpha} A \triangleright Q_{1}$ then there exists some $\mu_{i} \in A$ such that $\mu_{i} \in\{\alpha, \underline{\alpha}\}$. So, by rule $\operatorname{READ}_{r_{1}}$, $\mu_{i} \triangleright \ldots \triangleright \mu_{n} \triangleright \llbracket Q_{1} \rrbracket \stackrel{\alpha}{\sim} \mu_{i} \triangleright \ldots \triangleright \mu_{n} \triangleright \llbracket Q_{1} \rrbracket$ and, by repeated applications of rule $\operatorname{READ}_{r_{2}}$, $\llbracket Q \rrbracket=\mu_{1} \triangleright \ldots \mu_{i} \triangleright \ldots \triangleright \llbracket Q \rrbracket \stackrel{\alpha}{\rightsquigarrow} \mu_{1} \triangleright \ldots \triangleright \mu_{i} \triangleright \ldots \triangleright \llbracket Q_{1} \rrbracket$. If $Q \xrightarrow{\alpha} Q^{\prime}$ because of $Q_{1} \xrightarrow{\alpha} Q^{\prime}$ then $\llbracket Q_{1} \rrbracket \xrightarrow{\alpha} \llbracket Q^{\prime} \rrbracket$ by induction hypothesis. Since, $Q$ read-proper implies $Q_{1}$ is read-guarded, we even have (by Proposition C.1) $\llbracket Q_{1} \rrbracket \stackrel{\alpha}{\mapsto} \llbracket Q^{\prime} \rrbracket$. We are done by repeated applications of Reado.
2. If $\llbracket Q \rrbracket=\mu_{1} \triangleright \ldots \triangleright \mu_{n} \triangleright \llbracket Q_{1} \rrbracket \xrightarrow{\alpha} Q^{\prime \prime}$ we have either $\{\alpha, \underline{\alpha}\} \cap A \neq \emptyset$ (i.e. there exists some $\mu_{i} \in A$ such that $\left.\mu_{i} \in\{\alpha, \underline{\alpha}\}\right)$ and $Q^{\prime \prime}=\llbracket Q \rrbracket$ and we are done similarly to the previous case; or (again by Proposition C.1, since $Q_{1}$ is read-guarded) $\llbracket Q_{1} \rrbracket \stackrel{\alpha}{\mapsto} Q^{\prime \prime}$. Then, by induction hypothesis $Q_{1} \xrightarrow{\alpha} Q^{\prime}$ and, by operational rules, $Q \xrightarrow{\alpha} Q^{\prime}$ with $\llbracket Q^{\prime} \rrbracket=Q^{\prime \prime}$.

Sum: $Q=Q_{1}+Q_{2}$ with $Q_{1}$ and $Q_{2}$ read-proper and read-guarded.

1. Assume that $Q \xrightarrow{\alpha} Q^{\prime}$ because of $Q_{1} \xrightarrow{\alpha} Q^{\prime}$ (if $Q \xrightarrow{\alpha} Q^{\prime}$ since $Q_{2} \xrightarrow{\alpha} Q^{\prime}$, the proof is symmetric). By induction hypothesis, we have $\llbracket Q_{1} \rrbracket \xrightarrow{\alpha} \llbracket Q^{\prime} \rrbracket$. Moreover, since $Q_{1}$ is readguarded, also $\llbracket Q_{1} \rrbracket \stackrel{\alpha}{\mapsto} \llbracket Q^{\prime} \rrbracket$ (again by Proposition C.1). Thus, $\llbracket Q \rrbracket=\llbracket Q_{1} \rrbracket+\llbracket Q_{2} \rrbracket \xrightarrow{\alpha} \llbracket Q^{\prime} \rrbracket$.
2. Since $Q_{1}$ and $Q_{2}$ are read-guarded, we have $Q_{1} \not ⿻ \overbrace{}^{*}$ and $Q_{2} \not \underset{\sim}{*}$ again by Proposition C.1. Thus, $\llbracket Q \rrbracket=\llbracket Q_{1} \rrbracket+\llbracket Q_{2} \rrbracket \stackrel{\alpha}{\rightarrow} Q^{\prime \prime}$ if either $\llbracket Q_{1} \rrbracket \stackrel{\alpha}{\mapsto} Q^{\prime \prime}$ or $\llbracket Q_{2} \rrbracket \stackrel{\alpha}{\mapsto} Q^{\prime \prime}$. By induction hypothesis, it is either $Q_{1} \xrightarrow{\alpha} Q^{\prime}$ or $Q_{2} \xrightarrow{\alpha} Q^{\prime}$ with $\llbracket Q^{\prime} \rrbracket=Q^{\prime \prime}$. By operational rules, we have $Q \xrightarrow{\alpha} Q^{\prime}$.

Par: $Q=Q_{1} \|_{B} Q_{2}$ with $Q_{1}$ and $Q_{2}$ read-proper.

1. Assume $Q \xrightarrow{\alpha} Q^{\prime}$ and consider the following possible subcases:

- $\alpha \notin B, Q_{1} \xrightarrow{\alpha} Q_{1}^{\prime}$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}\right)$. If $Q_{1} \xrightarrow{\alpha} Q_{1}^{\prime}$ then, by induction hypothesis, $\llbracket Q_{1} \rrbracket \xrightarrow{\alpha} \llbracket Q_{1}^{\prime} \rrbracket$ and $\llbracket Q \rrbracket=\llbracket Q_{1} \rrbracket \|_{B} \llbracket Q_{2} \rrbracket \xrightarrow{\alpha} \operatorname{clean}\left(\llbracket Q_{1}^{\prime} \rrbracket \|_{B} \llbracket Q_{2} \rrbracket\right)=$ clean $\left(\llbracket Q_{1}^{\prime} \|_{B} Q_{2} \rrbracket\right)=\llbracket \operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}\right) \rrbracket=\llbracket Q^{\prime} \rrbracket$ by Proposition C.5-3.
- either $\alpha \notin B, Q_{2} \xrightarrow{\alpha} Q_{2}^{\prime}$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1} \|_{B} Q_{2}^{\prime}\right)$ or $\alpha \in B, Q_{i} \xrightarrow{\alpha} Q_{i}^{\prime}$, for $i=1,2$, and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}\right)$. Both these cases can be proved as the previous one.

2. Assume $\llbracket Q \rrbracket=\llbracket Q_{1} \rrbracket \|_{B} \llbracket Q_{2} \rrbracket \xrightarrow{\alpha} Q^{\prime \prime}$ and consider the following possible subcases:

- $\alpha \notin B, \llbracket Q_{1} \rrbracket \xrightarrow{\alpha} Q_{1}^{\prime \prime}$ and $Q^{\prime \prime}=\operatorname{clean}\left(Q_{1}^{\prime \prime} \|_{B} \llbracket Q_{2} \rrbracket\right)$. By induction hypothesis, $\llbracket Q_{1} \rrbracket \xrightarrow{\alpha}$ $Q_{1}^{\prime \prime}$ implies $Q_{1} \xrightarrow{\alpha} Q_{1}^{\prime}$ with $\llbracket Q_{1}^{\prime} \rrbracket=Q_{1}^{\prime \prime}$. Thus, $Q \xrightarrow{\alpha}$ clean $\left(Q_{1}^{\prime} \|_{B} Q_{2}\right)=Q^{\prime}$. Moreover, $Q^{\prime \prime}=\operatorname{clean}\left(Q_{1}^{\prime \prime} \|_{B} \llbracket Q_{2} \rrbracket\right)=\operatorname{clean}\left(\llbracket Q_{1}^{\prime} \rrbracket \|_{B} \llbracket Q_{2} \rrbracket\right)=\operatorname{clean}\left(\llbracket Q_{1}^{\prime} \|_{B} Q_{2} \rrbracket\right)=$ $\llbracket \operatorname{clean}\left(Q_{1}^{\prime} \|_{B} Q_{2}\right) \rrbracket=\llbracket Q^{\prime} \rrbracket$, by Proposition C.5-3.
- either $\alpha \notin B, \llbracket Q_{2} \rrbracket \xrightarrow{\alpha} Q_{2}^{\prime \prime}$ and $Q^{\prime \prime}=\operatorname{clean}\left(\llbracket Q_{1} \rrbracket \|_{B} Q_{2}^{\prime \prime}\right)$ or $\alpha \in B, \llbracket Q_{i} \rrbracket \xrightarrow{\alpha} Q_{i}^{\prime \prime}$, for $i=1,2$, and $Q^{\prime \prime}=\operatorname{clean}\left(Q_{1}^{\prime \prime} \|_{B} Q_{2}^{\prime \prime}\right)$. These cases can be proved as the previous one.

Rel: $Q=Q_{1}[\Phi]$ with $Q_{1}$ read-proper.

1. $Q \xrightarrow{\alpha} Q^{\prime}$ if there exists $\beta \in \Phi^{-1}(\alpha)$ such that $Q_{1} \xrightarrow{\beta} Q_{1}^{\prime}$ and $Q^{\prime}=Q_{1}^{\prime}[\Phi]$. By induction hypothesis, $\llbracket Q_{1} \rrbracket \xrightarrow{\beta} \llbracket Q_{1}^{\prime} \rrbracket$ and, hence $\llbracket Q \rrbracket=\llbracket Q_{1} \rrbracket[\Phi] \xrightarrow{\alpha} \llbracket Q_{1}^{\prime} \rrbracket[\Phi]=\llbracket Q^{\prime} \rrbracket$.
2. $\llbracket Q \rrbracket=\llbracket Q_{1} \rrbracket[\Phi] \xrightarrow{\alpha} Q_{1}^{\prime \prime}[\Phi]=Q^{\prime \prime}$ if there exists $\beta \in \Phi^{-1}(\alpha)$ such that $\llbracket Q_{1} \rrbracket \xrightarrow{\beta} Q_{1}^{\prime \prime}$. By induction hypothesis, $Q_{1} \xrightarrow{\beta} Q_{1}^{\prime}$ with $Q_{1}^{\prime \prime}=\llbracket Q_{1}^{\prime} \rrbracket$. Thus, $Q \xrightarrow{\alpha} Q_{1}^{\prime}[\Phi]=Q^{\prime}$. Moreover, $\llbracket Q^{\prime} \rrbracket=\llbracket Q_{1}^{\prime} \rrbracket[\Phi]=Q_{1}^{\prime \prime}[\Phi]=Q^{\prime \prime}$.

Rec: $Q=$ rec $x . Q_{1}$ with $Q_{1}$ read-proper. Let us define $P=\operatorname{rec} x$.unmark $\left(Q_{1}\right)$. By an easy induction on $Q_{1}$ we can prove that $\llbracket Q_{1}\{P / x\} \rrbracket=\llbracket Q_{1} \rrbracket\{\llbracket P \rrbracket / x\}$ and thus $\llbracket Q_{1}\{P / x\} \rrbracket=$ $\llbracket Q_{1} \rrbracket\left\{\operatorname{rec} x\right.$. $\left.\llbracket \operatorname{unmark}\left(Q_{1}\right) \rrbracket / x\right\}=\llbracket Q_{1} \rrbracket\left\{\operatorname{rec} x\right.$.unmark $\left.\left(\llbracket Q_{1} \rrbracket\right) / x\right\}$ by Proposition C.5-2.

1. We have $Q \xrightarrow{\alpha} Q^{\prime}$ since $Q_{1}\{P / x\} \xrightarrow{\alpha} Q^{\prime}$. By induction hypothesis, $\llbracket Q_{1}\{P / x\} \rrbracket=$ $\llbracket Q_{1} \rrbracket\left\{\operatorname{rec} x\right.$.unmark $\left.\left(\llbracket Q_{1} \rrbracket\right) / x\right\} \xrightarrow{\alpha} \llbracket Q^{\prime} \rrbracket$. By operational rules $\llbracket Q \rrbracket=\operatorname{rec} x . \llbracket Q_{1} \rrbracket \xrightarrow{\alpha} \llbracket Q^{\prime} \rrbracket$.
2. By the operational rules, $\llbracket Q \rrbracket \xrightarrow{\alpha} Q^{\prime \prime}$ if $\llbracket Q_{1} \rrbracket\left\{\operatorname{rec} x\right.$.unmark $\left.\left(\llbracket Q_{1} \rrbracket\right) / x\right\}=\llbracket Q_{1}\{P / x\} \rrbracket \xrightarrow{\alpha} Q^{\prime \prime}$. By induction hypothesis, we have $Q_{1}\{P / x\} \xrightarrow{\alpha} Q^{\prime}$ with $Q^{\prime \prime}=\llbracket Q^{\prime} \rrbracket$. Finally, $Q_{1}\{P / x\} \xrightarrow{\alpha}$ $Q^{\prime}$ implies $Q \xrightarrow{\alpha} Q^{\prime}$.

Proposition C. 7 For all read-proper $Q \in \tilde{\mathbb{S}}$ :

1. $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $\llbracket Q \rrbracket \xrightarrow{X}{ }_{r} \llbracket Q^{\prime} \rrbracket$;
2. $\llbracket Q \rrbracket \xrightarrow{X}_{r} Q^{\prime \prime}$ implies $Q \xrightarrow{X} r Q^{\prime}$ with $\llbracket Q^{\prime} \rrbracket=Q^{\prime \prime}$.

Proof: We prove these statements by induction on $Q$. We only prove some significant cases; the other ones follow easily by induction hypothesis.

Nil: $Q=$ nil. Trivial, since $Q=$ nil $=\llbracket Q \rrbracket \xrightarrow{X}_{r}$ nil.
Var: $Q=x$. Not possible since neither $Q$ nor $\llbracket Q \rrbracket$ can perform any $X$-step.
Pref: $Q=\alpha . P$ or $Q=\underline{\alpha} . P$ We prove only the latter case (the former is easier).

1. $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $\alpha \notin X \cup\{\tau\}$ and $Q^{\prime}=\underline{\alpha} . P$. By the operational rules, if $\alpha \notin X \cup\{\tau\}$ then $\llbracket Q \rrbracket=\underline{\alpha} \cdot \llbracket P \rrbracket \xrightarrow{X}_{r} \underline{\alpha} \cdot \llbracket P \rrbracket=\llbracket Q^{\prime} \rrbracket$.
2. Similar to the previous one.

Read: $Q=\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}$. Let $A=\left\{\alpha_{1}, \ldots, \alpha_{n}\right\} \subseteq \mathbb{A}_{\tau}$ such that $\mu_{i} \in\left\{\alpha_{i}, \underline{\alpha_{i}}\right\}$ for each $i \in[1, n]$.

1. By operational rules, $Q \xrightarrow{X} r \underline{\left\{\mu_{1}, \ldots, \mu_{n}\right\}} \triangleright Q_{1}^{\prime}=\left\{\underline{\alpha_{1}}, \ldots, \underline{\alpha_{n}}\right\} \triangleright Q_{1}^{\prime}=Q^{\prime}$ if $Q_{1} \xrightarrow{X} r Q_{1}^{\prime}$ and $\mathcal{U}\left(\left\{\mu_{1}, \ldots, \mu_{n}\right\}\right) \cap(X \cup\{\tau\})=\emptyset$. By induction hypothesis, $\llbracket Q_{1} \rrbracket{ }^{X}{ }_{r} \llbracket Q_{1}^{\prime} \rrbracket$. Moreover, $\mathcal{U}\left(\left\{\mu_{1}, \ldots, \mu_{n}\right\}\right) \cap(X \cup\{\tau\})=\emptyset$ implies either $\mu_{i}=\alpha_{i}$ or $\mu_{i}=\underline{\alpha_{i}}$ and $\alpha_{i} \notin X \cup\{\tau\}$ for each $i \in[1, n]$. Thus, by repeated applications of rules $\operatorname{READ}_{t 1}$ and $\operatorname{READ}_{t 2}, \llbracket Q \rrbracket=$ $\mu_{1} \triangleright \ldots \triangleright \mu_{n} \triangleright \llbracket Q_{1} \rrbracket \xrightarrow{X} r \underline{\alpha_{1}} \triangleright \ldots \triangleright \underline{\alpha_{n}} \triangleright \llbracket Q_{1}^{\prime} \rrbracket=\llbracket Q^{\prime} \rrbracket$.
2. $\llbracket Q \rrbracket=\mu_{1} \triangleright \ldots \triangleright \mu_{n} \triangleright \llbracket Q_{1} \rrbracket \xrightarrow{X}_{r} Q^{\prime \prime}$ is derived by repeated applications of rules $\operatorname{READ}_{t 1}$ and $\operatorname{READ}_{t 2}$, hence (i) $\llbracket Q_{1} \rrbracket \xrightarrow{X}_{r} Q_{1}^{\prime \prime}$, (ii) for each $i \in[1, n]$, either $\mu_{i}=\alpha_{i}$ or $\mu_{i}=$ $\underline{\alpha_{i}}$ and $\alpha_{i} \notin X \cup\{\tau\}$ and (iii) $Q^{\prime \prime}=\underline{\alpha_{1}} \triangleright \ldots \triangleright \underline{\alpha_{n}} \triangleright Q_{1}^{\prime \prime}$. If $\llbracket Q_{1} \rrbracket \xrightarrow{X}_{r} Q_{1}^{\prime \prime}$ then, by induction hypothesis, $Q_{1} \xrightarrow{X} r Q_{1}^{\prime}$ and $Q_{1}^{\prime \prime}=\llbracket Q_{1}^{\prime} \rrbracket$. Moreover, by (ii), we have also $\mathcal{U}\left(\left\{\mu_{1}, \ldots, \mu_{n}\right\}\right) \cap(X \cup\{\tau\})=\emptyset$. Thus, $Q \xrightarrow{X}{ }_{r} \underline{\left\{\mu_{1}, \ldots, \mu_{n}\right\} \triangleright Q_{1}^{\prime}=\left\{\underline{\alpha_{1}}, \ldots, \underline{\alpha_{n}}\right\} \triangleright Q_{1}^{\prime}=Q^{\prime}, ~}$ with $\llbracket Q^{\prime} \rrbracket=\underline{\alpha_{1}} \triangleright \ldots \triangleright \underline{\alpha_{n}} \triangleright \llbracket Q_{1}^{\prime} \rrbracket=\underline{\alpha_{1}} \triangleright \ldots \triangleright \underline{\alpha_{n}} \triangleright Q_{1}^{\prime \prime}=Q^{\prime \prime}$.

## D A Proof of Proposition 5.10

This section is devoted to proving Proposition 5.10.
Proposition 5.10 Let $Q, Q^{\prime} \in \mathrm{L}(\tilde{\mathbb{P}})$ and $A \subseteq \mathbb{A}_{\tau}$. Then:

1. $Q \xrightarrow{\alpha} Q^{\prime}$ and $s=\left\langle v_{1}, \ldots, v_{n}\right\rangle \in \operatorname{UE}(Q, A)$ implies either $s \in \operatorname{UE}\left(Q^{\prime}, A\right)$ or there exists some $j \in[1, n]$ such that $v_{j} \notin \operatorname{LAB}\left(Q^{\prime}\right)$.
2. $\quad Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)$.

## Proof:

We start proving Item 1. Since $Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$ implies $Q^{\prime}=Q$ and, hence, $\operatorname{UE}\left(Q^{\prime}, A\right)=\operatorname{UE}(Q, A)$, we only prove that $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ and $s=\left\langle v_{1}, \ldots, v_{n}\right\rangle \in \mathrm{UE}(Q, A)$ implies either $s \in \operatorname{UE}\left(Q^{\prime}, A\right)$ or $v_{j} \notin \operatorname{LAB}\left(Q^{\prime}\right)$ for some $j \in[1, n]$. We proceed by induction on derivation $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$.

Nil, Var: $Q=$ nil $_{u}, Q=x_{u}$. This case is not possible since $Q \stackrel{q}{\nrightarrow}$.
Pref: $Q=\alpha_{u} \cdot P_{1}$ or $Q=\underline{\alpha}_{u} \cdot P_{1}$ with $P_{\in} \mathrm{L}_{u 1}\left(\tilde{\mathbb{P}}_{1}\right)$. Of course only the latter case is possible. Then $Q \stackrel{\alpha}{\mapsto} P_{1}, s \in \mathrm{UE}(Q, A)$ implies $\alpha \notin A$ and $s=\langle u\rangle$. By Fact $5.5-2, u \notin \operatorname{LAB}\left(P_{1}\right)$.

Read: $Q=\mu_{u 1} \triangleright_{u} Q_{1}$ with $Q_{1} \in \mathrm{~L}_{u 2}(\tilde{\mathbb{P}})$. By operational rules $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ implies $Q_{1} \stackrel{\alpha}{\mapsto} Q^{\prime}$ and, by Fact $5.5-2, Q^{\prime} \in \mathrm{L}_{v}(\tilde{\mathbb{P}})$ with $u 2 \leq v$. Moreover, $s \in \operatorname{UE}(Q, A)$ implies either $s=\langle u 1\rangle$ or $s=\left\langle v_{1}, \ldots, v_{n}\right\rangle \in \mathrm{UE}\left(Q_{1}, A\right)$. In the latter case the statement follows by induction hypothesis. In the former one, as in the Pref case, $s=\langle u 1\rangle$ and $Q^{\prime} \in \mathrm{L}_{v}(\tilde{\mathbb{P}})$ with $u 2 \leq v$ implies $u \notin \operatorname{LAB}\left(Q^{\prime}\right)$.
Sum: $Q=Q_{1}+{ }_{u} Q_{2}$. By the operational semantics $Q_{1}+{ }_{u} Q_{2} \stackrel{\alpha}{\mapsto} Q^{\prime}$ if either $Q_{1} \stackrel{\alpha}{\mapsto} Q^{\prime}$ or $Q_{2} \stackrel{\alpha}{\mapsto} Q^{\prime}$. Assume the former case. The other one is similar. If $s \in \operatorname{UE}\left(Q_{1}, A\right)$ then by induction hypothesis either $s \in \operatorname{UE}\left(Q^{\prime}, A\right)$ or $v_{j} \notin \operatorname{LAB}\left(Q^{\prime}\right)$ for some $j \in[1, n]$. Then assume $s \in$ $\mathrm{UE}\left(Q_{2}, A\right)$. By the labelling function, each $v_{j} \in \operatorname{LAB}\left(Q_{1}\right)$ is of the form $v_{j}=u 1 u_{j}$ while each $v_{j} \in \operatorname{LAB}\left(Q_{2}\right)$ is of the form $v_{j}=u 2 u_{j}$, for some label $u_{j}$. Then by Fact $5.5-2$, we have $v_{j} \notin \operatorname{LAB}\left(Q_{1}\right)$ and $v_{j} \notin \operatorname{LAB}\left(Q^{\prime}\right)$, for any $j \in[1, n]$.

Par: $Q=Q_{1} \|_{B}^{u} Q_{2}$. Assume $Q \xrightarrow{\alpha} Q^{\prime}$ and $s=\left\langle v_{1}, \ldots, v_{n}\right\rangle \in \operatorname{UE}(Q, A)$.
By $s \in \operatorname{UE}\left(Q_{1} \|_{B}^{u} Q_{2}, A\right)$ we have either (i) $s \in \operatorname{UE}\left(Q_{1}, A \cup B\right)$, (ii) $s \in \operatorname{UE}\left(Q_{2}, A \cup B\right)$ or (iii) $s \in \operatorname{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$, for some $\alpha \in B \backslash A$. Now consider the following three possible cases:

- $\alpha \notin B, Q_{1} \stackrel{\alpha}{\mapsto} Q_{1}^{\prime}$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right)$.

Consider case (i). By induction hypothesis it is either $s \in \operatorname{UE}\left(Q_{1}^{\prime}, A \cup B\right)$ or $v_{j} \notin$ $\operatorname{LAB}\left(Q_{1}^{\prime}\right)$ for some $j \in[1, n]$. If $s \in \operatorname{UE}\left(Q_{1}^{\prime}, A \cup B\right)$ then $s \in \operatorname{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}, A\right)=$ $\operatorname{UE}\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right), A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)$ by Lemma A.11. Now assume that $v_{j} \notin \operatorname{LAB}\left(Q_{1}^{\prime}\right)$, for some $j \in[1, n]$. Since $s \in \mathrm{UE}\left(Q_{1}, A \cup B\right)$ implies also $v_{j} \neq u$ and $v_{j} \notin \operatorname{LAB}\left(Q_{2}\right)$ (Fact 5.4), we have that $v_{j} \notin \operatorname{LAB}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right)=\operatorname{LAB}\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right)\right)=\operatorname{LAB}\left(Q^{\prime}\right)$.

Consider case (ii). Then, again by Lemma A.11, we have that $s \in \operatorname{UE}\left(Q_{2}, A \cup B\right) \subseteq$ $\operatorname{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}, A\right)=\operatorname{UE}\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right), A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)$.
Finally consider case (iii). By definition of $\times$, if $s \in \mathrm{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \mathrm{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ then there exist $s_{1}$ and $s_{2}$ process labels such that $s_{1} \in \operatorname{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ and $s_{2} \in$ $\operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ and $s=s_{1} \times s_{2}$. By induction hypothesis, either $s_{1} \in \operatorname{UE}\left(Q_{1}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ or $v_{j} \notin \operatorname{LAB}\left(Q_{1}^{\prime}\right)$ for some $j \in[1, n]$. If $s_{1} \in \operatorname{UE}\left(Q_{1}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ then it is also $s=s_{1} \times s_{2} \in$ $\operatorname{UE}\left(Q_{1}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \subseteq \operatorname{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}, A\right)=\operatorname{UE}\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right), A\right)=$
$\mathrm{UE}\left(Q^{\prime}, A\right)$, again by Lemma A.11. If $v_{j} \notin \mathrm{LAB}\left(Q_{1}^{\prime}\right)$ as in the previous cases we have that $v_{j} \notin \operatorname{LAB}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right)=\operatorname{LAB}\left(Q^{\prime}\right)$.

- $\alpha \notin B, Q_{2} \stackrel{\alpha}{\mapsto} Q_{2}^{\prime}$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1} \|_{B}^{u} Q_{2}^{\prime}\right)$. This case is similar to the previous one.
- $\alpha \in B, Q_{i} \stackrel{\alpha}{\mapsto} Q_{i}^{\prime}$ for $i=1,2$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)$. Consider case (i). By induction hypothesis either $s \in \operatorname{UE}\left(Q_{1}^{\prime}, A \cup B\right)$ or $v_{j} \notin \operatorname{LAB}\left(Q_{1}^{\prime}\right)$ for some $j \in[1, n]$. As in the previous items, we can prove that $s \in \operatorname{UE}\left(Q_{1}^{\prime}, A \cup B\right)$ implies $s \in \operatorname{UE}\left(Q_{1}^{\prime} \|_{B} Q_{2}^{\prime}, A\right)=\mathrm{UE}\left(Q^{\prime}, A\right)$ and $v_{j} \notin \mathrm{LAB}\left(Q_{1}^{\prime}\right)$ implies $v_{j} \notin \mathrm{LAB}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)=\mathrm{LAB}\left(Q^{\prime}\right)$. Case (ii) can be proven similarly. Then consider case (iii). By definition of $\times, s \in \operatorname{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ implies there are $s_{1}$ and $s_{2}$ process labels such that $s_{i}=\left\langle v_{i 1}, \ldots, v_{i n_{i}}\right\rangle \in \operatorname{UE}\left(Q_{i}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$. By induction hypothesis, if both $s_{1} \in \operatorname{UE}\left(Q_{1}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ and $s_{2} \in \operatorname{UE}\left(Q_{2}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ then $s_{1} \times s_{2} \in \mathrm{UE}\left(Q_{1}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{UE}\left(Q_{2}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \subseteq \operatorname{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}, A\right)=\mathrm{UE}\left(Q^{\prime}, A\right)$. If $v_{1 j} \notin$ $\operatorname{LAB}\left(Q_{1}^{\prime}\right)$ (similarly for $v_{2 j} \notin \operatorname{LAB}\left(Q_{2}^{\prime}\right)$ ) then, as in the Sum case, we have that $v_{1 j} \notin$ $\operatorname{LAB}\left(Q_{2}^{\prime}\right)$ and hence also $v_{1 j} \notin \operatorname{LAB}\left(Q^{\prime}\right)$.

Rel: $Q=Q_{1}\left[\Phi_{u}\right]$. By the operational semantics, $Q \stackrel{\alpha}{\mapsto} Q_{1}^{\prime}\left[\Phi_{u}\right]$ if there exists $\beta \in \Phi^{-1}(\alpha)$ such that $Q_{1} \stackrel{\beta}{\mapsto} Q_{1}^{\prime}$. Moreover, $s=\left\langle v_{1}, \ldots v_{n}\right\rangle \in \mathrm{UE}\left(Q_{1}\left[\Phi_{u}\right], A\right)$ if $s \in \mathrm{UE}\left(Q_{1}, \Phi^{-1}(A)\right)$. By induction hypothesis either $s \in \operatorname{UE}\left(Q_{1}^{\prime}, \Phi^{-1}(A)\right)$ or $v_{j} \notin \operatorname{LAB}\left(Q_{1}^{\prime}\right)$ for some $j \in[1, n]$. In the former case $s \in \operatorname{UE}\left(Q_{1}^{\prime}\left[\Phi_{u}\right], A\right)$. In the latter one, $v_{j} \in \operatorname{LAB}\left(Q_{1}\right)$ implies $v \neq u$ and hence also $v_{j} \notin \operatorname{LAB}\left(Q_{1}^{\prime}\left[\Phi_{u}\right]\right)$.

Rec: $Q=\operatorname{rec} x_{u} \cdot Q_{1}$. Let $S_{1}=\operatorname{unmark}\left(Q_{1}\right)$ and $S=Q_{1}\left\{\operatorname{rec} x_{u} \cdot S_{1} / x\right\}$. By operational rules $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ implies $S \stackrel{\alpha}{\mapsto} Q^{\prime}$. Now assume $s \in \operatorname{UE}(Q, A)=\mathrm{UE}\left(Q_{1}, A\right)=\mathrm{UE}(S, A)$ by Proposition A.4-2. By induction hypothesis we have either $s \in \mathrm{UE}\left(Q^{\prime}, A\right)$ or $v_{j} \notin \mathrm{LAB}\left(Q^{\prime}\right)$ for some $j \in[1, n]$.

Then prove Item 2. The two statements are proven by induction on $Q$.
Var, Stop: $Q=x_{u}$. This case is not possible since $Q \stackrel{\text { P }}{\stackrel{y}{\longrightarrow} \text {. }}$
Nil: $Q=$ nil ${ }_{u}$. In this case $Q \xrightarrow{X}$ nil $=Q^{\prime}$ and $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)=\emptyset$ for any $A \subseteq \mathbb{A}_{\tau}$.

Pref: $Q=\alpha_{u} \cdot P_{1}$ or $Q=\underline{\alpha}_{u} \cdot P_{1}$. We prove only the latter case (the former one can be proven similarly). Assume that $Q \xrightarrow{X} \underline{\alpha}_{u} \cdot P_{1}=Q^{\prime}$. If $\alpha \notin A$ then $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)=$ $\{\langle u\rangle\}$, otherwise $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)=\emptyset$.
Read: $Q=\alpha_{u} \triangleright Q_{1}$ or $Q=\underline{\alpha}_{u} \triangleright Q_{1}$. We prove only the latter case (the former one can be proven similarly). By operational rules, $Q \xrightarrow{X} Q^{\prime}$ implies $Q_{1} \xrightarrow{X} Q_{1}^{\prime}$ and $Q^{\prime}=\underline{\alpha}_{u} \triangleright Q_{1}^{\prime}$. If $\alpha \notin A$ then, by induction hypothesis, $\operatorname{LE}(Q, A)=\{\langle u\rangle\} \cup \operatorname{LE}\left(Q_{1}, A\right)=\{\langle u\rangle\} \cup \operatorname{LE}\left(Q_{1}^{\prime}, A\right)=\operatorname{LE}\left(Q^{\prime}, A\right)$. Similarly we can prove that $\operatorname{LE}(Q, A)=\operatorname{UE}\left(Q^{\prime}, A\right)$. If $\alpha \notin A$, then $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, A\right)=$ $\operatorname{LE}\left(Q^{\prime}, A\right)$ and, similarly, $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, A\right)=\operatorname{UE}\left(Q_{1}^{\prime}, A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)$.

Sum: $Q=Q_{1}+{ }_{u} Q_{2}$. By the operational rule $Q \xrightarrow{X} Q_{1}^{\prime}+{ }_{u} Q_{2}^{\prime}$ implies $Q_{1} \xrightarrow{X} Q_{1}^{\prime}$ and $Q_{2} \xrightarrow{X} Q_{2}^{\prime}$. By induction hypothesis $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, A\right) \cup \operatorname{LE}\left(Q_{2}, A\right)=\operatorname{LE}\left(Q_{1}^{\prime}, A\right) \cup \operatorname{LE}\left(Q_{2}^{\prime}, A\right)=\operatorname{LE}\left(Q^{\prime}, A\right)$. Similarly $\operatorname{LE}\left(Q^{\prime}, A\right)=\operatorname{LE}\left(Q_{1}^{\prime}, A\right) \cup \operatorname{LE}\left(Q_{2}^{\prime}, A\right)=\operatorname{UE}\left(Q_{1}^{\prime}, A\right) \cup \operatorname{UE}\left(Q_{2}^{\prime}, A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)$.

Par: $Q=Q_{1} \|_{A}^{u} Q_{2}$. In this case, we have that $Q \xrightarrow{X} Q^{\prime}$ if $X \subseteq\left(A \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash A\right)$, $Q_{1} \xrightarrow{X_{1}} Q_{1}^{\prime}$ and $Q_{2} \xrightarrow{X_{2}} Q_{2}^{\prime}$ and $Q^{\prime}=Q_{1}^{\prime} \|_{A}^{u} Q_{2}^{\prime}$. By induction hypothesis $\operatorname{LE}\left(Q_{i}, A\right)=$ $\mathrm{LE}\left(Q_{i}^{\prime}, A\right)=\operatorname{UE}\left(Q_{i}^{\prime}, A\right)$, for $i=1,2$. Then: $\operatorname{LE}(Q, A)=$
$\operatorname{LE}\left(Q_{1}, A \cup B\right) \cup \operatorname{LE}\left(Q_{2}, A \cup B\right) \cup\left(\cup_{\alpha \in B \backslash A} \operatorname{LE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{LE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)\right)=$
$\operatorname{LE}\left(Q_{1}^{\prime}, A \cup B\right) \cup \operatorname{LE}\left(Q_{2}^{\prime}, A \cup B\right) \cup\left(\cup_{\alpha \in B \backslash A} \operatorname{LE}\left(Q_{1}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{LE}\left(Q_{2}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)\right)=$
$\operatorname{LE}\left(Q_{1}^{\prime} \|_{A} Q_{2}^{\prime}, A\right)=\operatorname{LE}\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{A} Q_{2}^{\prime}\right), A\right)=\operatorname{LE}\left(Q^{\prime}, A\right)$, by Proposition A.10-1. Similarly we can prove that $\mathrm{LE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q_{1}^{\prime} \|_{A} Q_{2}^{\prime}, A\right)=\operatorname{UE}\left(\operatorname{clean}\left(Q_{1}^{\prime} \|_{A} Q_{2}^{\prime}\right), A\right)=\operatorname{UE}\left(Q^{\prime}, A\right)$, by Lemma A.11.
Rel: $Q=Q_{1}\left[\Phi_{u}\right] . Q \xrightarrow{X} Q_{1}^{\prime}\left[\Phi_{u}\right]$ implies $Q_{1} \xrightarrow{\Phi^{-1}(X \cup\{\tau\}) \backslash\{\tau\}} Q_{1}^{\prime}$. By induction hypothesis we have that $\operatorname{LE}\left(Q_{1}, A\right)=\operatorname{LE}\left(Q_{1}^{\prime}, A\right)=\operatorname{UE}\left(Q_{1}^{\prime}, A\right)$. Thus $\operatorname{LE}(Q, A)=\operatorname{LE}\left(Q_{1}, \Phi^{-1}(A)\right)=$ $\operatorname{LE}\left(Q_{1}^{\prime}, \Phi^{-1}(A)\right)=\operatorname{LE}\left(Q^{\prime}, A\right)$. Similarly, $\operatorname{LE}\left(Q_{1}^{\prime}, \Phi^{-1}(A)\right)=\operatorname{UE}\left(Q_{1}^{\prime}, \Phi^{-1}(A)\right)=\operatorname{UE}\left(Q^{\prime}, A\right)$.
Rec: $Q=$ rec $x_{u} \cdot Q_{1} . Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$ and $Q^{\prime}=$ rec $x_{u} \cdot Q_{1}^{\prime}$. By induction hypothesis $\operatorname{LE}\left(Q^{\prime}, A\right)=\operatorname{LE}\left(Q_{1}^{\prime}, A\right)=\operatorname{LE}\left(Q_{1}, A\right)=\operatorname{LE}(Q, A)$ and $\operatorname{UE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q_{1}^{\prime}, A\right)=\operatorname{LE}\left(Q_{1}, A\right)=$ $\operatorname{LE}(Q, A)$.

## E A Proof of Proposition 5.11

This section is devoted to proving Proposition 5.11. A preliminary lemma is needed.
Lemma E. 1 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}}), X$ and $Y \subseteq \mathbb{A}$.

1. $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ and $Y \cap \mathcal{U}(Q, A)=\emptyset$ imply $Q \xrightarrow{X \cup(Y \backslash A)}{ }_{r} Q^{\prime}$;
2. $Q \xrightarrow{X}_{r}$ implies $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$;
3. $Q$ action-guarded and $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$ implies $Q \xrightarrow{X}{ }_{r}$.

Proof: We prove these items together by induction on $Q$.
Var: $Q=x_{u}$. This case is not possible since $Q \stackrel{\nsim}{\nmid} r$ and $Q$ is not action-guarded.
Nil: $Q=$ nil $_{u}$. In this case:

1. $Q \xrightarrow{X}_{r}$ nil, $Y \cap \mathcal{U}(Q, A)=\emptyset$ and $Q \xrightarrow{X \cup(Y \backslash A)} r$ nil.
2. $Q \xrightarrow{X}_{r}$ and $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$.
3. $Q$ is action-guarded, $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$ and $Q \xrightarrow{X}{ }_{r}$.

Pref: $Q=\alpha_{u} \cdot P_{1}$ or $Q=\underline{\alpha}_{u} \cdot P_{1}$. Consider only the second case (the first case is similar to the Nil-case).

1. $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies, by operational rules, $\alpha \notin X \cup\{\tau\}$ and $Q^{\prime}=\underline{\alpha}_{u} \cdot P_{1}$. If $\alpha \in A$ then, easily, $\alpha \notin Y \backslash A$. Otherwise, $\alpha \notin A$ and $Y \cap \mathcal{U}(Q, A)=Y \cap\{\alpha\}=\emptyset$ imply $\alpha \notin Y$. So, again $\alpha \notin Y \backslash A$. Thus, $\alpha \notin(X \cup(Y \backslash A)) \cup\{\tau\}$ and, again by operational rules, $Q \xrightarrow{X \cup(Y \backslash A)} r \underline{\alpha}_{u} \cdot P_{1}=Q^{\prime}$
2. $Q \xrightarrow{X}$ implies $\alpha \notin X \cup\{\tau\}$ and, hence, $\alpha \in \mathbb{A} \backslash X$. Then $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$.
3. $Q$ is action-guarded. Moreover, $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$ implies $\alpha \in \mathbb{A} \backslash X$. Since $\tau \neq \alpha \in \mathbb{A}$ and $\alpha \notin X$, we have that $\alpha \notin X \cup\{\tau\}$ and, hence, $Q \xrightarrow{X}_{r}$.

Read: $Q=\alpha_{u 1} \triangleright_{u} Q_{1}$ or $Q=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}$. Consider only the second case (the first case is easier).

1. $Q \xrightarrow{X}_{r} Q^{\prime}$ implies, by operational rules, $\alpha \notin X \cup\{\tau\}, Q_{1} \xrightarrow{X}_{r} Q_{1}^{\prime}$ and $Q^{\prime}=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime}$. By induction hypothesis, $Q_{1} \xrightarrow{X}_{r} Q_{1}^{\prime}$ and $Y \cap \mathcal{U}\left(Q_{1}, A\right) \subseteq Y \cap \mathcal{U}(Q, A)=\emptyset$ implies $Q_{1} \xrightarrow{X \cup(Y \backslash A)} r Q_{1}^{\prime}$. Furthermore, if $\alpha \in A$ then, easily, $\alpha \notin Y \backslash A$. If $\alpha \notin A$ then $\emptyset=Y \cap \mathcal{U}(Q, A) \supseteq Y \cap\{\alpha\}$ imply $\alpha \notin Y$. So, it is again $\alpha \notin Y \backslash A$. Thus, $\alpha \notin$ $(X \cup(Y \backslash A)) \cup\{\tau\}$. Finally, again by operational rules, $Q \xrightarrow{X \cup(Y \backslash A)} r \underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime}=Q^{\prime}$.
2. $Q \xrightarrow{X}_{r}$ implies $\alpha \notin X \cup\{\tau\}$ and $Q_{1} \xrightarrow{X}_{r}$. By induction hypothesis it is $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right)=\emptyset$. Moreover, $\alpha \notin X \cup\{\tau\}$ implies $\alpha \in \mathbb{A} \backslash X$. Then $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$.
3. Assume $Q$ and, hence, $Q_{1}$ action-guarded. Assume, moreover, $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$, i.e. $\alpha \in \mathbb{A} \backslash X$ and $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right)=\emptyset . \quad Q_{1}$ action-guarded and $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right)=\emptyset$ implies, by induction hypothesis that $Q_{1} \xrightarrow{X}_{r}$. Moreover, $\alpha \in \mathbb{A} \backslash X$ implies $\tau \neq \alpha \in \mathbb{A}$ and $\alpha \notin X$, that is $\alpha \notin X \cup\{\tau\}$. Finally, by operational rule, $Q \xrightarrow{X}{ }_{r}$.

Sum: $Q=Q_{1}+{ }_{u} Q_{2}$

1. $Q \xrightarrow{X}_{r} Q^{\prime}$ and $Y \cap \mathcal{U}(Q, A)=Y \cap\left(\mathcal{U}\left(Q_{1}, A\right) \cup \mathcal{U}\left(Q_{2}, A\right)\right)=\emptyset$ imply $Q_{i} \xrightarrow{X}_{r} Q_{i}^{\prime}, Y \cap$ $\mathcal{U}\left(Q_{i}, A\right)=\emptyset$ for $i=1,2$ and $Q^{\prime}=Q_{1}^{\prime}+{ }_{u} Q_{2}^{\prime}$. By induction hypothesis $Q_{1} \xrightarrow{X \cup(Y \backslash A)}{ }_{r} Q_{1}^{\prime}$, $Q_{2} \xrightarrow{X \cup(Y \backslash A)} r Q_{2}^{\prime}$. Thus, by operational rules, $Q \xrightarrow{X \cup(Y \backslash A)} Q_{1}^{\prime}+Q_{2}^{\prime}=Q^{\prime}$.
2. If $Q \xrightarrow{X} r$ then $Q_{1} \xrightarrow{X} r$ and $Q_{2} \xrightarrow{X} r$. By induction hypothesis $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right)=\emptyset$, $\mathcal{U}\left(Q_{2}, \mathbb{A} \backslash X\right)=\emptyset$ and, hence, $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$.
3. In this case $Q$ guarded implies both $Q_{1}$ and $Q_{2}$ guarded. Moreover if $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$ then $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right)=\mathcal{U}\left(Q_{2}, \mathbb{A} \backslash X\right)=\emptyset$. By induction hypothesis $Q_{1} \xrightarrow{X}_{r}, Q_{2} \xrightarrow{X}_{r}$ and, hence, $Q \xrightarrow{X}$.

Par: $Q=Q_{1} \|_{B}^{u} Q_{2}$.

1. If $Q \xrightarrow{X} r Q^{\prime}$ then, by operational rules, there exist $X_{1}, X_{2}$ such that $Q_{1} \xrightarrow{X_{1}}{ }_{r} Q_{1}^{\prime}$, $Q_{2} \xrightarrow{X_{2}}{ }_{r} Q_{2}^{\prime}, X \subseteq\left(B \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash B\right)$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)$. Now, let $A_{1}=\left(\mathcal{U}\left(Q_{1}\right) \backslash \mathcal{U}\left(Q_{2}\right)\right) \cap B$ and $A_{2}=\left(\mathcal{U}\left(Q_{2}\right) \backslash \mathcal{U}\left(Q_{1}\right)\right) \cap B$. Now we want to prove that $Y \cap \mathcal{U}(Q, A)=\emptyset$ implies $Y \cap \mathcal{U}\left(Q_{1}, A \cup A_{1}\right)=Y \cap \mathcal{U}\left(Q_{2}, A \cup A_{2}\right)=\emptyset$.
Assume $Y \cap \mathcal{U}(Q, A)=\emptyset$ and, by contradiction, $\alpha \in Y \cap \mathcal{U}\left(Q_{1}, A \cup A_{1}\right) \neq \emptyset$. Then, by Propositions A.1-1 and A.1-4, $\alpha \in Y$ such that $\alpha \in \mathcal{U}\left(Q_{1}\right), \alpha \notin A$ and $\alpha \notin A_{1}$.
We have to consider two possible subcases. If $\alpha \notin B$ then $\alpha \in \mathcal{U}\left(Q_{1}\right)$ and $\alpha \notin A \cup B$ implies $\alpha \in \mathcal{U}\left(Q_{1}, A \cup B\right) \subseteq \mathcal{U}(Q, A)$ (see Proposition A.1-2). Otherwise, if $\alpha \in B$ then $\alpha \in \mathcal{U}\left(Q_{1}\right)$ and $\alpha \notin A_{1}$ implies also $\alpha \in \mathcal{U}\left(Q_{2}\right)$. Thus $\alpha \in \mathcal{U}\left(Q_{1}\right) \cap \mathcal{U}\left(Q_{2}\right) \cap B$ such that $\alpha \notin A$. Again by Proposition A.1-2, it is $\alpha \in \mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B \subseteq \mathcal{U}(Q, A)$. In both cases, we have $\alpha \in Y \cap \mathcal{U}(Q, A)=\emptyset$
This prove that $Y \cap \mathcal{U}(Q, A)=\emptyset$ implies $Y \cap \mathcal{U}\left(Q_{1}, A \cup A_{1}\right)=\emptyset$. Similarly we can prove that if $Y \cap \mathcal{U}(Q, A)=\emptyset$ then also $Y \cap \mathcal{U}\left(Q_{2}, A \cup A_{2}\right)=\emptyset$. By induction hypothesis $Q_{1} \xrightarrow{X_{1} \cup\left(Y \backslash\left(A \cup A_{1}\right)\right)} r Q_{1}^{\prime}$ and $Q_{2} \xrightarrow{X_{2} \cup\left(Y \backslash\left(A \cup A_{2}\right)\right)} r Q_{2}^{\prime}$. Let $X_{1}^{\prime}=X_{1} \cup\left(Y \backslash\left(A \cup A_{1}\right)\right)$ and $X_{2}^{\prime}=X_{2} \cup\left(Y \backslash\left(A \cup A_{2}\right)\right)$. By operational rules it remains to prove that $X \cup(Y \backslash A) \subseteq$ $\left(B \cap\left(X_{1}^{\prime} \cup X_{2}^{\prime}\right)\right) \cup\left(\left(X_{1}^{\prime} \cap X_{2}^{\prime}\right) \backslash B\right)$. First of all, $X_{1} \subseteq X_{1}^{\prime}$ and $X_{2} \subseteq X_{2}^{\prime}$ imply $X \subseteq$ $\left(B \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash B\right) \subseteq\left(B \cap\left(X_{1}^{\prime} \cup X_{2}^{\prime}\right)\right) \cup\left(\left(X_{1}^{\prime} \cap X_{2}^{\prime}\right) \backslash B\right)$. Now assume $\alpha \in Y \backslash A$ and consider the following possible subcases:

- $\alpha \notin B$. Then $\alpha \notin A_{1}$ and $\alpha \notin A_{2}$ implies $\alpha \in Y \backslash\left(A \cup A_{1}\right) \subseteq X_{1}^{\prime}$ and $\alpha \in$ $Y \backslash\left(A \cup A_{2}\right) \subseteq X_{2}^{\prime}$. Thus, $\alpha \in\left(X_{1}^{\prime} \cap X_{2}^{\prime}\right) \backslash B$.
- $\alpha \in B$. In this case, $\alpha \notin A_{1}$ implies $\alpha \in Y \backslash\left(A \cup A_{1}\right) \subseteq X_{1}^{\prime}$. If, otherwise, $\alpha \in A_{1}=$ $\left(\mathcal{U}\left(Q_{1}\right) \backslash \mathcal{U}\left(Q_{2}\right)\right) \cap B$, then $\alpha \notin \mathcal{U}\left(Q_{2}\right)$ implies $\alpha \notin A_{2}$ and, hence, $\mu \in Y \backslash\left(A \cup A_{2}\right) \subseteq$ $X_{2}^{\prime}$. In both cases $\mu \in B \cap\left(X_{1}^{\prime} \cup X_{2}^{\prime}\right)$.
We can conclude that $Q \xrightarrow{X \cup(Y \backslash A)}{ }_{r} Q^{\prime}$.

2. If $Q \xrightarrow{X} r$ then $Q_{1}{\xrightarrow{X_{1}}}_{r}, Q_{2} \xrightarrow{X_{2}} r$ with $X \subseteq\left(B \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash B\right)$. By induction hypothesis $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X_{1}\right)=\mathcal{U}\left(Q_{2}, \mathbb{A} \backslash X_{2}\right)=\emptyset$.
Now, assume toward a contradiction that $\alpha \in \mathcal{U}(Q, \mathbb{A} \backslash X) \neq \emptyset$. By Proposition A. 1 (Items 4. and 1.) $\alpha \in \mathcal{U}(Q)$ such that $\alpha \notin \mathbb{A} \backslash X$. We distinguish the following possible subcases:

- $\alpha=\tau$. Then $\alpha \in \mathcal{U}(Q)$ implies either $\alpha \in \mathcal{U}\left(Q_{1}, B\right)$ or $\alpha \in \mathcal{U}\left(Q_{2}, B\right)$. Moreover, surely $\tau \notin \mathbb{A} \backslash X_{1}$ and $\tau \notin \mathbb{A} \backslash X_{2}$. By Proposition A.1-2., we have either $\alpha \in \mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X_{1}\right)=\emptyset$ or $\alpha \in \mathcal{U}\left(Q_{2}, \mathbb{A} \backslash X_{2}\right)=\emptyset$.
- $\alpha \in \mathbb{A}$ (and, since $\alpha \notin \mathbb{A} \backslash X$, also $\alpha \in X$ ) such that $\alpha \notin B$. As in the above case, we have that $\alpha \in \mathcal{U}(Q)$ implies either $\alpha \in \mathcal{U}\left(Q_{1}, B\right)$ or $\alpha \in \mathcal{U}\left(Q_{2}, B\right)$. Moreover, $\alpha \in X \backslash B$ implies $\alpha \in X_{1} \cap X_{2}$ and hence both $\alpha \notin \mathbb{A} \backslash X_{1}$ and $\alpha \notin \mathbb{A} \backslash X_{2}$. As in the above case we can prove that either $\alpha \in \mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X_{1}\right)=\emptyset$ or $\alpha \in \mathcal{U}\left(Q_{2}, \mathbb{A} \backslash X_{2}\right)=\emptyset$.
- $\alpha \in \mathbb{A}$ (and, since $\alpha \notin \mathbb{A} \backslash X$, also $\alpha \in X$ ) such that $\alpha \in B$. In such a case $\alpha \in \mathcal{U}(Q)$ implies $\alpha \in \mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B$. Moreover, $\alpha \in X \cap B$ implies $\alpha \in X_{1} \cup X_{2}$ and hence either $\alpha \notin \mathbb{A} \backslash X_{1}$ or $\alpha \notin \mathbb{A} \backslash X_{2}$. Also in this case we can conclude that either $\alpha \in \mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X_{1}\right)=\emptyset$ or $\alpha \in \mathcal{U}\left(Q_{2}, \mathbb{A} \backslash X_{2}\right)=\emptyset$.

3. Let us assume $Q$ action-guarded (and, hence, both $Q_{1}$ and $Q_{2}$ action-guarded) and $\mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$. By Definition 2.2 it is $\mathcal{U}\left(Q_{1},(\mathbb{A} \backslash X) \cup B\right)=\mathcal{U}\left(Q_{2},(\mathbb{A} \backslash X) \cup B\right)=\emptyset$ and $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right) \cap \mathcal{U}\left(Q_{2}, \mathbb{A} \backslash X\right) \cap B=\emptyset$. First we prove that $(\mathbb{A} \backslash X) \cup B=\mathbb{A} \backslash(X \backslash B)$.
" $\subseteq$ " If $\alpha \in \mathbb{A} \backslash X$ then $\mathbb{A} \backslash X \subseteq \mathbb{A} \backslash(X \backslash B)$ implies also $\alpha \in \mathbb{A} \backslash(X \backslash B)$. If, otherwise, $\alpha \in B \subseteq \mathbb{A}$ then we have $\alpha \notin X \backslash B$ and hence $\alpha \in \mathbb{A} \backslash(X \backslash B)$.
"?" If $\alpha \in \mathbb{A} \backslash(X \backslash B)$, then $\alpha \in \mathbb{A}$ such that either $\alpha \notin X$ or $\alpha \in X \cap B$. Thus, it is either $\alpha \in \mathbb{A} \backslash X$ or $\alpha \in B$. In both cases $\alpha \in(\mathbb{A} \backslash X) \cup B$.
$Q_{i}$ action-guarded and $\mathcal{U}\left(Q_{i},(\mathbb{A} \backslash X) \cup B\right)=\mathcal{U}\left(Q_{i}, \mathbb{A} \backslash(X \backslash B)\right)=\emptyset$ implies by induction hypothesis, $Q_{i} \xrightarrow{X \backslash B}$ for $i=1,2$. Now, let us denote with $X_{1}^{\prime}=(X \cap B) \backslash \mathcal{U}\left(Q_{1}\right)$ and with $X_{2}^{\prime}=(X \cap B) \backslash \mathcal{U}\left(Q_{2}\right)$. Then: $Q_{i} \xrightarrow{X \backslash B} r$ and $X_{i}^{\prime} \cap \mathcal{U}\left(Q_{i}\right)=\emptyset$ implies by Item 1 $Q_{i} \xrightarrow{(X \backslash B) \cup X_{i}^{\prime}} r$. Moreover it is also $X_{1}^{\prime} \cup X_{2}^{\prime}=X \cap B$. Indeed, let us assume (toward a contradiction) that there exists $\alpha \in X \cap B$ such that both $\alpha \notin X_{1}^{\prime}$ and $\alpha \notin X_{2}^{\prime}$ and, hence, that both $\alpha \in \mathcal{U}\left(Q_{1}\right)$ and $\alpha \in \mathcal{U}\left(Q_{2}\right)$. Then, $\alpha \in \mathcal{U}\left(Q_{1}\right) \cap \mathcal{U}\left(Q_{2}\right) \cap B$ such that $\alpha \notin \mathbb{A} \backslash X$. Thus, by A.1-2, $\alpha \in \mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right) \cap \mathcal{U}\left(Q_{2}, \mathbb{A} \backslash X\right) \cap B \subseteq \mathcal{U}(Q, \mathbb{A} \backslash X)=\emptyset$.
Let $X_{1}=(X \backslash B) \cup X_{1}^{\prime}$ and $X_{2}=(X \backslash B) \cup X_{2}^{\prime}$. By operational rules, to prove that $Q \xrightarrow{X} r$ it still remains to show that $X \subseteq\left(B \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash B\right)$. This follows easily because $\left.\left(X_{1} \cap X_{2}\right) \backslash B\right)=X \backslash B$ and $B \cap\left(X_{1} \cup X_{2}\right)=X_{1}^{\prime} \cup X_{2}^{\prime}=X \cap B$.

Rel: $Q=Q_{1}\left[\Phi_{u}\right]$. As a first statement (that wil be useful in the remain of the proof) we prove that if $X \subseteq \mathbb{A}$ and $X^{\prime}=\Phi^{-1}(X \cup\{\tau\}) \backslash\{\tau\}$ then $\Phi^{-1}(\mathbb{A} \backslash X)=\mathbb{A} \backslash X^{\prime}$. Let $\mu \in \Phi^{-1}(\mathbb{A} \backslash X)$. Then $\mu \in \mathbb{A}_{\tau}$ such that $\Phi(\mu) \in \mathbb{A}$ and $\Phi(\mu) \notin X$. In particular, $\Phi(\mu) \in \mathbb{A}$ implies $\mu \neq \tau$ (since $\Phi(\tau)=\tau \notin \mathbb{A}$ ) and $\Phi(\mu) \notin\{\tau\}$. Thus, $\mu \in \mathbb{A}$ such that $\Phi(\mu) \notin X \cup\{\tau\}$ and, hence, $\mu \notin \Phi^{-1}(X \cup\{\tau\}) \supseteq X^{\prime}$. We can conclude that $\mu \in \mathbb{A} \backslash X^{\prime}$.
Now, let $\mu \in \mathbb{A} \backslash X^{\prime}$. Then $\mu \neq \tau$ and $\mu \notin X^{\prime}$ imply $\mu \notin \Phi^{-1}(X \cup\{\tau\})$ and, hence, $\Phi(\mu) \notin$ $X \cup\{\tau\}$. Finally, $\Phi(\mu) \notin X$ and $\Phi(\mu) \neq \tau$ imply $\Phi(\mu) \in \mathbb{A} \backslash X$ and, hence, $\mu \in \Phi^{-1}(\mathbb{A} \backslash X)$.

1. Assume $Q \xrightarrow{X} r Q_{1}^{\prime}\left[\Phi_{u}\right]=Q^{\prime}$ and $Y \cap \mathcal{U}(Q, A)=Y \cap \Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)\right)=\emptyset$. Then (by operational rules) $Q_{1} \xrightarrow{X^{\prime}} Q_{1}^{\prime}$ and $\Phi^{-1}(Y) \cap \mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)=\emptyset$. By induction hypothesis $Q_{1} \xrightarrow{X^{\prime} \cup\left(\Phi^{-1}(Y) \backslash \Phi^{-1}(A)\right)}{ }_{r} Q_{1}^{\prime}$. Moreover, since $\Phi(\tau)=\tau$ and $Y \subseteq \mathbb{A}$ imply $\tau \notin$ $\Phi^{-1}(Y), \tau \notin \Phi^{-1}(Y) \backslash \Phi^{-1}(A)=\Phi^{-1}(Y \backslash A)$ and, hence, $\Phi^{-1}(Y \backslash A)=\Phi^{-1}(Y \backslash A) \backslash\{\tau\}$, we have $X^{\prime} \cup\left(\Phi^{-1}(Y) \backslash \Phi^{-1}(A)\right)=\left(\Phi^{-1}(X \cup\{\tau\}) \backslash\{\tau\}\right) \cup\left(\Phi^{-1}(Y \backslash A) \backslash\{\tau\}\right)=$ $\left(\Phi^{-1}(X \cup\{\tau\}) \cup \Phi^{-1}(Y \backslash A)\right) \backslash\{\tau\}=\Phi^{-1}(X \cup\{\tau\} \cup(Y \backslash A)) \backslash\{\tau\}=$ $\Phi^{-1}((X \cup(Y \backslash A)) \cup\{\tau\}) \backslash\{\tau\}$.
Finally, again by operational rules, $Q \xrightarrow{X \cup(Y \backslash A)}{ }_{r} Q_{1}^{\prime}\left[\Phi_{u}\right]=Q^{\prime}$
2. Assume $Q \xrightarrow{X}$ r and, hence, $Q_{1} \xrightarrow{X^{\prime}}$. By induction hypothesis it is $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X^{\prime}\right)=$ $\mathcal{U}\left(Q_{1}, \Phi^{-1}(\mathbb{A} \backslash X)\right)=\emptyset$. Thus $\mathcal{U}(Q, \mathbb{A} \backslash X)=\Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}(\mathbb{A} \backslash X)\right)\right)=\emptyset$.
3. Assume $Q$ action-guarded and $\mathcal{U}(Q, \mathbb{A} \backslash X)=\Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}(\mathbb{A} \backslash X)\right)\right)=\emptyset$. Then we have also $Q_{1}$ action-guarded and $\mathcal{U}\left(Q_{1}, \Phi^{-1}(\mathbb{A} \backslash X)\right)=\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X^{\prime}\right)=\emptyset$. By induction hypothesis $Q_{1} \xrightarrow{X^{\prime}}$ ad, hence, $Q \xrightarrow{X} r$.

Rec: $Q=\operatorname{rec} x_{u} \cdot Q_{1}$.

1. If $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ then $Q_{1} \xrightarrow{X}_{r} Q_{1}^{\prime}$ and $Q^{\prime}=$ rec $x_{u} \cdot Q_{1}^{\prime}$. Moreover, assume $Y \cap \mathcal{U}(Q, A)=$ $Y \cap \mathcal{U}\left(Q_{1}\right)=\emptyset$. By induction hypothesis we have that $Q_{1} \xrightarrow{X \cup(Y \backslash A)}{ }_{r} Q_{1}^{\prime}$ and, by the operational semantics, $Q \xrightarrow{X \cup(Y \backslash A)}{ }_{r}$ rec $x_{u} \cdot Q_{1}^{\prime}=Q^{\prime}$.
2. Assume $Q \xrightarrow{X} r$ and hence $Q_{1} \xrightarrow{X}_{r}$. By induction hypothesis we have that $\mathcal{U}(Q, \mathbb{A} \backslash X)=$ $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right)=\emptyset$.
3. In such a case $Q$ action-guarded implies $Q_{1}$ action-guarded. Moreover, $\mathcal{U}(Q, \mathbb{A} \backslash X)=$ $\mathcal{U}\left(Q_{1}, \mathbb{A} \backslash X\right)=\emptyset$ implies, by induction hypothesis, $Q_{1} \xrightarrow{X}_{r}$ and, hence, $Q \xrightarrow{X}_{r}$.

Proposition 5.11 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$ and $A \subseteq \mathbb{A}_{\tau}$. Then:

1. $Q \xrightarrow{1}$ implies $\mathcal{U}(Q)=\emptyset$;
2. $Q$ guarded and $\mathcal{U}(Q)=\emptyset$ implies $Q \xrightarrow{1}$;
3. $\mathcal{U}(Q, A)=\emptyset$ if and only if $\operatorname{UE}(Q, A)=\emptyset$.

Proof: Items 1. and 2. are easy corollary of Lemma E.1. Item 3. is proven below by induction on $Q$.

Nil, Var: $Q=\operatorname{nil}_{u}, Q=x_{u}$. In these cases $\mathcal{U}(Q, A)=\emptyset$ and $\operatorname{UE}(Q, A)=\emptyset$.
Pref: $Q=\alpha_{u} . P_{1}$ or $Q=\underline{\alpha}_{u} \cdot P_{1}$. Consider only the latter case (the former is similar to the previous ones). $\mathcal{U}(Q, A)=\emptyset$ if and only if $\alpha \in A$ and, hence, if and only if $\operatorname{UE}(Q, A)=\emptyset$.

Read: $Q=\alpha_{u 1} \triangleright_{u} Q_{1}$ or $Q=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}$. Consider only the latter case (the former is similar to the previous ones). $\mathcal{U}(Q, A)=\emptyset$ if and only if $\alpha \in A$ and $\mathcal{U}\left(Q_{1}, A\right)=\emptyset$ if and only if, by induction hypothesis $\alpha \in A$ and $\operatorname{UE}\left(Q_{1}, A\right)=\emptyset$ if and only if $\operatorname{UE}(Q, A)=\emptyset$.

Sum: $Q=Q_{1}+{ }_{u} Q_{2} . \mathcal{U}(Q, A)=\emptyset \operatorname{iff} \mathcal{U}\left(Q_{1}, A\right)=\emptyset$ and $\mathcal{U}\left(Q_{2}, A\right)=\emptyset$, iff, by induction hypothesis, $\operatorname{UE}\left(Q_{1}, A\right)=\emptyset, \operatorname{UE}\left(Q_{2}, A\right)=\emptyset$ and $\operatorname{UE}(Q, A)=\emptyset$.

Par: $Q=Q_{1} \|_{B}^{u} Q_{2}$. We first prove that $\mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B=\emptyset$ if and only if, for each $\alpha \in B \backslash A$, either $\mathcal{U}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$ or $\mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$.

Assume $\mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B=\emptyset$ and - toward a contradiction - that there exists $\alpha \in B \backslash A$ such that $\mathcal{U}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \neq \emptyset$ and $\mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \neq \emptyset$. Since $\beta \in \mathcal{U}\left(Q_{i}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$ implies (by Proposition A.1-1.) $\beta \notin \mathbb{A}_{\tau} \backslash\{\alpha\}$ (that is $\beta=\alpha$ ), we have that $\emptyset \neq \mathcal{U}\left(Q_{i}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \subseteq\{\alpha\}$ and hence $\mathcal{U}\left(Q_{i}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\{\alpha\}$ for $i=1,2$. Thus, $\alpha \in \mathcal{U}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \cap \mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$. Finally, since it is also $\alpha \in B \backslash A, \alpha \in \mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B=\emptyset$ (see Proposition A.1-2.).

To prove the inverse implication we observe that, if $\alpha \in \mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B \neq \emptyset$ then $\alpha \in B \backslash A$ (again by Proposition A.1-1.) such that $\alpha \in \mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right)$. Since surely $\alpha \notin \mathbb{A}_{\tau} \backslash\{\alpha\}$, it is also (by Proposition A.1-2.) $\alpha \in \mathcal{U}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \cap \mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \neq \emptyset$. As above this allows us to conclude that $\mathcal{U}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\{\alpha\} \neq \emptyset$
Now, $\mathcal{U}(Q, A)=\emptyset$ iff $\mathcal{U}\left(Q_{1}, A \cup B\right)=\mathcal{U}\left(Q_{2}, A \cup B\right)=\emptyset$ and $\mathcal{U}\left(Q_{1}, A\right) \cap \mathcal{U}\left(Q_{2}, A\right) \cap B=\emptyset$, iff $\mathcal{U}\left(Q_{1}, A \cup B\right)=\mathcal{U}\left(Q_{2}, A \cup B\right)=\emptyset$ and, for each $\alpha \in B \backslash A$, either $\mathcal{U}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$ or $\mathcal{U}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$, iff (by induction hypothesis) $\operatorname{UE}\left(Q_{1}, A \cup B\right)=\operatorname{UE}\left(Q_{2}, A \cup B\right)=\emptyset$ and, for each $\alpha \in B \backslash A$, either $\operatorname{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$ or $\operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$, iff $\operatorname{UE}\left(Q_{1}, A \cup B\right)=$ $\operatorname{UE}\left(Q_{2}, A \cup B\right)=\emptyset$ and, for each $\alpha \in B \backslash A, \operatorname{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\emptyset$, iff $\mathrm{UE}(Q, A)=\emptyset$.

Rel: $Q=Q_{1}\left[\Phi_{u}\right] . \mathcal{U}(Q, A)=\Phi\left(\mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)\right)=\emptyset$ iff $\mathcal{U}\left(Q_{1}, \Phi^{-1}(A)\right)=\emptyset$ iff, by induction hypothesis, $\operatorname{UE}\left(Q_{1}, \Phi^{-1}(A)\right)=\operatorname{UE}(Q, A)=\emptyset$.

Rec: $Q=\operatorname{rec} x_{u} \cdot Q_{1}$. In this case $\mathcal{U}(Q, A)=\mathcal{U}\left(Q_{1}, A\right)=\emptyset$ if and only if, by induction hypothesis, $\operatorname{UE}\left(Q_{1}, A\right)=\operatorname{UE}(Q, A)=\emptyset$.

## F A Proof of Proposition 5.12

This section is devoted to proving Proposition 5.12. A preliminary lemma is needed.
Proposition F. 1 Let $Q, \in \mathrm{~L}(\tilde{\mathbb{P}}), A, X \subseteq \mathbb{A}$. Then clean $(Q, A) \xrightarrow{X}{ }_{r} Q^{\prime}$ implies $Q \xrightarrow{X \backslash A}{ }_{r} Q^{\prime}$.
Proof: By induction on $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$
Nil, Var: $Q=\operatorname{nil}_{u}, Q=x_{u}$. The latter case is not possible since clean $(Q, A)=x_{u} \stackrel{X}{\nmid} r$. Assume $Q=$ nil $_{u}$. Then clean $(Q, A)=$ nil $_{u} \xrightarrow{X}_{r}$ nil $_{u}$ and $Q \xrightarrow{X \backslash A}$ nil $_{u}$.

Pref: $Q=\alpha_{u} \cdot P_{1}$ or $Q=\underline{\alpha}_{u} \cdot P_{1}$. We prove only the latter case (the former one is similar to the Nil-case). We have two possible subcases:

- $\alpha \in A$. In this case clean $(Q, A)=\alpha_{u} \cdot P_{1} \xrightarrow{X}_{r} \underline{\alpha}_{u} \cdot P_{1}$. Moreover $\alpha \in A \subseteq \mathbb{A}$ implies $\alpha \notin(X \backslash A) \cup\{\tau\}$ and, by operational rules, $Q \xrightarrow{X \backslash A} r \underline{\alpha}_{u} \cdot P_{1}$.
- $\alpha \notin A$ In this case clean $(Q, A)=\underline{\alpha}_{u} \cdot P_{1} \xrightarrow{X}_{r} \underline{\alpha}_{u} . P_{1}$ implies $\alpha \notin X \cup\{\tau\} \supseteq(X \backslash A) \cup\{\tau\}$. By operational rules, $Q \xrightarrow{X \backslash A} \underline{\alpha}_{u} \cdot P_{1}$.
Read: $Q=\alpha_{u 1} \triangleright_{u} Q_{1}$ or $Q=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}$. We prove only the latter case (the former one is easier). We have two possible subcases:
- $\alpha \in A$. By operational rules, clean $(Q, A)=\alpha_{u 1} \triangleright_{u}$ clean $\left(Q_{1}, A\right) \xrightarrow{X}{ }_{r} \underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime}=Q$ if clean $\left(Q_{1}, A\right) \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$. By induction hypothesis $Q_{1} \xrightarrow{X \backslash A} Q_{1}^{\prime}$. Moreover $\alpha \in A \subseteq \mathbb{A}$ implies $\alpha \notin(X \backslash A) \cup\{\tau\}$. Thus, again by operational rules, $Q \xrightarrow{X \backslash A} \underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime}=Q^{\prime}$.
- $\alpha \notin A$. In this case clean $(Q, A)=\underline{\alpha}_{u 1} \triangleright_{u}$ clean $\left(Q_{1}, A\right) \xrightarrow{X}_{r} \underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime}=Q$ if it is both $\alpha \notin X \cup\{\tau\} \supseteq(X \backslash A) \cup\{\tau\}$ and clean $\left(Q_{1}, A\right) \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$. As in the above case we can prove that $Q \xrightarrow{X \backslash A} r \underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime}=Q^{\prime}$.

Sum: $Q=Q_{1}+{ }_{u} Q_{2}$. By operational rules clean $(Q, A)=\operatorname{clean}\left(Q_{1}, A\right)+{ }_{u}$ clean $\left(Q_{2}, A\right) \xrightarrow{X}{ }_{r} Q^{\prime}$ implies clean $\left(Q_{1}, A\right) \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$, clean $\left(Q_{2}, A\right) \xrightarrow{X}{ }_{r}^{\prime}$ and $Q^{\prime}=Q_{1}^{\prime}+{ }_{u} Q_{2}^{\prime}$. By induction hypothesis $Q_{1} \xrightarrow{X \backslash A} Q_{1}^{\prime}, Q_{2} \xrightarrow{X \backslash A} Q_{2}^{\prime}$ and, by operational rules, $Q \xrightarrow{X \backslash A} Q^{\prime}$.

Par: $Q=Q_{1} \|_{B}^{u} Q_{2}$. Let $A_{1}=B \backslash \mathcal{U}\left(Q_{2}\right)$ and $\left.A_{2}=B\right) \backslash \mathcal{U}\left(Q_{1}\right)$. Let us assume that clean $(Q, A)=$ clean $\left(Q_{1}, A \cup A_{1}\right) \|_{B}^{u}$ clean $\left(Q_{2}, A \cup A_{2}\right) \xrightarrow{X}{ }_{r} Q^{\prime}$. By operational rules, there exist $X_{1}, X_{2} \subseteq \mathbb{A}$ such that clean $\left(Q_{i}, A \cup A_{i}\right) \xrightarrow{X_{i}}{ }_{r} Q_{i}^{\prime}$ for $i=1,2, X \subseteq\left(B \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash B\right)$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)$. By induction hypothesis $Q_{1} \xrightarrow{X_{1} \backslash\left(A \cup A_{1}\right)}{ }_{r} Q_{1}^{\prime}$ and $Q_{2} \xrightarrow{X_{2} \backslash\left(A \cup A_{2}\right)}{ }_{r}^{\prime}{ }_{2}$. Moreover, $A_{1} \cap \mathcal{U}\left(Q_{2}\right)=A_{2} \cap \mathcal{U}\left(Q_{1}\right)=\emptyset$ and Proposition E.1-1 implies $Q_{1} \xrightarrow{X_{1}^{\prime}}{ }_{r} Q_{1}^{\prime}$ and $Q_{2}{\xrightarrow{X_{2}^{\prime}}}_{r} Q_{2}^{\prime}$, where $X_{1}^{\prime}=\left(X_{1} \backslash\left(A \cup A_{1}\right)\right) \cup A_{2}$ and $X_{2}^{\prime}=\left(X_{2} \backslash\left(A \cup A_{2}\right)\right) \cup A_{1}$. By operational semantics, it remains to prove that $X \backslash A \subseteq\left(B \cap\left(X_{1}^{\prime} \cup X_{2}^{\prime}\right)\right) \cup\left(\left(X_{1}^{\prime} \cap X_{2}^{\prime}\right) \backslash B\right)$. Let $\alpha \in X \backslash A$.

- $\alpha \in B$. Then $\alpha \in X$ implies either $\alpha \in X_{1}$ or $\alpha \in X_{2}$. Assume $\alpha \in X_{1}$ (if $\alpha \in X_{2}$ the statement can be proved similarly). If $\alpha \notin A_{1}$ then, trivially, $\alpha \in X_{1} \backslash\left(A \cup A_{1}\right) \subseteq X_{1}^{\prime}$. Otherwise, if $\alpha \in A_{1}$, then $\alpha \in\left(X_{2} \backslash\left(A \cup A_{2}\right)\right) \cup A_{1}=X_{2}^{\prime}$. In both cases $\alpha \in X_{1}^{\prime} \cup X_{2}^{\prime}$.
- $\alpha \notin B$. Then $\alpha \in X$ implies both $\alpha \in X_{1}$ and $\alpha \in X_{2}$. Moreover $\alpha \notin A_{1}, A_{2} \subseteq B$ implies $\alpha \in X_{1} \backslash\left(A \cup A_{1}\right) \subseteq X_{1}^{\prime}$ and $\alpha \in X_{2} \backslash\left(A \cup A_{2}\right) \subseteq X_{2}^{\prime}$. Thus $\alpha \in X_{1}^{\prime} \cap X_{2}^{\prime}$.

Rel: $Q=Q_{1}\left[\Phi_{u}\right]$. Assume that clean $(Q, A)=\operatorname{clean}\left(Q_{1}, \Phi^{-1}(A)\right)\left[\Phi_{u}\right] \xrightarrow{X}{ }_{r} Q^{\prime}$. By operational rules, clean $\left(Q_{1}, \Phi^{-1}(A)\right) \xrightarrow{X^{\prime}} Q_{1}^{\prime}$, with $X^{\prime}=\Phi^{-1}(X \cup\{\tau\}) \backslash\{\tau\}$ and $Q^{\prime}=Q_{1}^{\prime}\left[\Phi_{u}\right]$. By induction hypothesis we have that $Q_{1} \xrightarrow{X^{\prime} \backslash \Phi^{-1}(A)}{ }_{r} Q_{1}^{\prime}$. Moreover $X^{\prime} \backslash \Phi^{-1}(A)=$
$\left(\Phi^{-1}(X \cup\{\tau\}) \backslash\{\tau\}\right) \backslash \Phi^{-1}(A)=\left(\Phi^{-1}(X \cup\{\tau\}) \backslash \Phi^{-1}(A)\right) \backslash\{\tau\}=\left(\Phi^{-1}((X \cup\{\tau\}) \backslash A)\right) \backslash\{\tau\}=$ $\left(\Phi^{-1}((X \backslash A) \cup\{\tau\}) \backslash\{\tau\}\right.$. By operational rules $Q \xrightarrow{X \backslash A}{ }_{r} Q_{1}^{\prime}\left[\Phi_{u}\right]=Q^{\prime}$.
Rec: $Q=\operatorname{rec} x_{u} \cdot Q_{1}$. clean $(Q, A)=\operatorname{rec} x_{u} . \operatorname{clean}\left(Q_{1}, A\right) \xrightarrow{X} r Q^{\prime}$ implies clean $\left(Q_{1}, A\right) \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$ and $Q^{\prime}=\operatorname{rec} x_{u} \cdot Q_{1}^{\prime}$. By induction hypothesis $Q_{1} \xrightarrow{X \backslash A} r Q_{1}^{\prime}$ and, by operational rules $Q \xrightarrow{X \backslash A} r$ rec $x_{u} \cdot Q_{1}^{\prime}=Q^{\prime}$.

Lemma F. 2 Let $Q, Q^{\prime}, Q^{\prime \prime} \in \mathrm{L}(\tilde{\mathbb{P}})$ and $X, X^{\prime} \subseteq \mathbb{A}$. Then:

1. $Q \xrightarrow{X}{ }_{r} Q^{\prime} \xrightarrow{X^{\prime}} Q^{\prime \prime}$ implies $Q \xrightarrow{\not t}$ and $Q^{\prime} \xrightarrow{\neq}$ for any $\mu \in X^{\prime} \cup\{\tau\}$. Moreover $Q^{\prime}=Q^{\prime \prime}$;
2. $Q$ action-guarded and $Q \xrightarrow{\not ้}$ for any $\mu \in X \cup\{\tau\}$ implies $Q \xrightarrow{X}{ }_{r} Q^{\prime}$ and $Q^{\prime} \not{ }_{\neq}^{\mu}$ for any $\mu \in X \cup\{\tau\}$.

Proof: We prove these items together by induction on $Q$.
Var: $Q=x_{u}$. This case is not possible since $Q \stackrel{X}{\rightarrow} r$ and $Q$ is not action-guarded.
Nil: $Q=$ nil $_{u}$.

1. $Q \xrightarrow{X}{ }_{r}$ nil $_{u}=Q^{\prime} \xrightarrow{X^{\prime}}{ }_{r}$ nil $_{u}=Q^{\prime \prime}, Q=Q^{\prime}=$ nil $_{u} \not{ }^{\mu}$ for any $\mu \in X^{\prime} \cup\{\tau\}$ and, trivially, nil $_{u}=$ nil $_{u}$.
2. $Q$ is action-guarded, $Q \xrightarrow{\nrightarrow}$ for any $\mu \in X \cup\{\tau\}, Q \xrightarrow{X}{ }_{r}$ nil $_{u}=Q^{\prime}$ and $Q^{\prime} \not{ }^{\nmid}$ for any $\mu \in X \cup\{\tau\}$.

Pref: $Q=\alpha_{u} \cdot P_{1}$ or $Q=\underline{\alpha}_{u} \cdot P_{1}$. Consider only the latter case (the former case is simpler).

1. $\underline{\alpha}_{u} \cdot P_{1} \xrightarrow{X} \underline{\alpha}_{u} \cdot P_{1}=Q^{\prime} \xrightarrow{X^{\prime}} \underline{\alpha}_{u} \cdot P_{1}=Q^{\prime \prime}$ implies $\alpha \notin X^{\prime} \cup\{\tau\}$. Thus, by operational semantics, both $Q$ and $Q^{\prime} \nRightarrow$ for any $\mu \in X^{\prime} \cup\{\tau\}$. Clearly $Q^{\prime}=Q^{\prime \prime}$.
2. In this case $Q$ is action-guarded. Moreover $Q \not{ }_{\neq}^{\mu}$ for any $\mu \in X \cup\{\tau\}$ implies $\alpha \notin X \cup\{\tau\}$ and, by operational rules, $Q \xrightarrow{X} r \underline{\alpha}_{u} \cdot P_{1}=Q^{\prime}$. Again by operational rules, $\alpha \notin X \cup\{\tau\}$ implies $Q^{\prime} \nRightarrow$ for any $\mu \in X \cup\{\tau\}$ 。

Read: $Q=\alpha_{u 1} \triangleright_{u} Q_{1}$ or $Q=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}$. Consider only the latter case (the former case is simpler).

1. $\underline{\alpha}_{u 1} \triangleright_{u} Q_{1} \xrightarrow{X}{ }_{r} \underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime}=Q^{\prime}{\xrightarrow{X^{\prime}}}_{r} \underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime \prime}=Q^{\prime \prime}$ implies $\alpha \notin X^{\prime} \cup\{\tau\}$ and $Q_{1} \xrightarrow{X} r$ $Q_{1}^{\prime} \xrightarrow{X^{\prime}} Q_{1}^{\prime \prime}$. By induction hypothesis we have that $Q_{1}, Q_{1}^{\prime} \xrightarrow{\nrightarrow}$ for any $\mu \in X^{\prime} \cup\{\tau\}$; moreover $Q_{1}^{\prime}=Q_{1}^{\prime \prime}$. By operational rules, $\alpha \notin X^{\prime} \cup\{\tau\}$ and $Q_{1}, Q_{1}^{\prime} \neq$ for any $\mu \in X^{\prime} \cup\{\tau\}$ implies $Q, Q^{\prime} \nRightarrow$ for any $\mu \in X^{\prime} \cup\{\tau\}$. Finally $Q_{1}^{\prime}=Q_{2}^{\prime \prime}$ implies $Q^{\prime}=Q^{\prime \prime}$.
2. $Q$ action-guarded implies that also $Q_{1}$ it is so. Moreover, $Q \nRightarrow$ for any $\mu \in X \cup\{\tau\}$ implies $\alpha \notin X \cup\{\tau\}$ and $Q_{1} \neq$ for any $\mu \in X \cup\{\tau\}$. By induction hypothesis, $Q_{1} \xrightarrow{X}{ }_{r}{ }_{r} Q_{1}^{\prime}$ and $Q_{1}^{\prime} \xrightarrow{\mu}$ for any $\mu \in X \cup\{\tau\}$. By the operational rules, $\alpha \notin X \cup\{\tau\}$ and $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$ implies $Q=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1} \xrightarrow{X} \underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime}=Q^{\prime}$. Finally, $\alpha \notin X \cup\{\tau\}$ and $Q_{1}^{\prime} \neq$ 生 for any $\mu \in X \cup\{\tau\}$ implies that $Q^{\prime}=\underline{\alpha}_{u 1} \triangleright_{u} Q_{1}^{\prime} \neq$ for any $\mu \in X \cup\{\tau\}$.

Sum：$Q=Q_{1}+{ }_{u} Q_{2}$ ．
1．If $Q \xrightarrow{X}{ }_{r} Q^{\prime} \xrightarrow{X^{\prime}} Q^{\prime \prime}$ then $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime} \xrightarrow{X^{\prime}} Q_{1}^{\prime \prime}, Q_{2} \xrightarrow{X}{ }_{r} Q_{2}^{\prime} \xrightarrow{X^{\prime}}{ }_{r} Q_{2}^{\prime \prime}, Q^{\prime}=Q_{1}^{\prime}+{ }_{u} Q_{2}^{\prime}$
 $\mu \in X \cup\{\tau\}$ and，hence，by operational rules，both $Q \stackrel{\not y}{\nrightarrow}$ and $Q^{\prime} \nRightarrow$ for any $\mu \in X^{\prime} \cup\{\tau\}$ ． Again by induction hypothesis，$Q_{1}^{\prime}=Q_{1}^{\prime \prime}$ and $Q_{2}^{\prime}=Q_{2}^{\prime \prime}$ ．Thus $Q^{\prime}=Q^{\prime \prime}$ ．
2．$Q$ guarded implies both $Q_{1}$ and $Q_{2}$ guarded．Assume $Q \xrightarrow{\mu}$ for any $\mu \in X \cup\{\tau\}$ ．Then，
 $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime}, Q_{2} \xrightarrow{X}{ }_{r} Q_{2}^{\prime}$ and，hence，$Q \xrightarrow{X}{ }_{r} Q_{1}^{\prime}+{ }_{u} Q_{2}^{\prime}=Q^{\prime}$ ．Moreover，again by induction hypothesis，we have that both $Q_{1}^{\prime}$ and $Q_{2}^{\prime} \nrightarrow \rightarrow$ for any $\mu \in X \cup\{\tau\}$ ．Then，by operational rules，also $Q^{\prime} \xrightarrow{\not \Longrightarrow}$ for any $\mu \in X \cup\{\tau\}$ ．

Par：$Q=Q_{1} \|_{B}^{u} Q_{2}$ ．
1．$Q \xrightarrow{X}{ }_{r} Q^{\prime}$ implies that there exist $X_{1}, X_{2}$ such that $Q_{1} \xrightarrow{X_{1}}{ }_{r} Q_{1}^{\prime}, Q_{2} \xrightarrow{X_{2}}{ }_{r} Q_{2}^{\prime}$ with $X \subseteq\left(B \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash B\right)$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)$ ．Let $A_{1}=B \backslash \mathcal{U}\left(Q_{2}^{\prime}\right)$ and $A_{2}=B \backslash \mathcal{U}\left(Q_{1}^{\prime}\right)$ and assume $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime}, A_{1}\right) \|_{B}^{u}$ clean $\left(Q_{2}^{\prime}, A_{2}\right) \xrightarrow{X_{r}^{\prime}} Q^{\prime \prime}$ ．Again， there exist $X_{1}^{\prime}, X_{2}^{\prime}$ such that clean $\left(Q_{1}^{\prime}, A_{1}\right) \xrightarrow{X_{1}^{\prime}}{ }_{r} Q_{1}^{\prime \prime}$ ，clean $\left(Q_{2}^{\prime}, A_{2}\right) \xrightarrow{X_{2}^{\prime}}{ }_{r} Q_{2}^{\prime \prime}$ with $X^{\prime} \subseteq$ $\left(B \cap\left(X_{1}^{\prime} \cup X_{2}^{\prime}\right)\right) \cup\left(\left(X_{1}^{\prime} \cap X_{2}^{\prime}\right) \backslash B\right)$ and $Q^{\prime \prime}=\operatorname{clean}\left(Q_{1}^{\prime \prime} \|_{B}^{u} Q_{2}^{\prime \prime}\right)$ ．If clean $\left(Q_{1}^{\prime}, A_{1}\right) \xrightarrow{X_{1}^{\prime}}{ }_{r} Q_{1}^{\prime \prime}$ then $Q_{1}^{\prime} \xrightarrow{X_{1}^{\prime} \backslash A_{1}}{ }_{r} Q_{1}^{\prime \prime}$（by Proposition F．1）．Moreover $A_{2} \cap \mathcal{U}\left(Q_{1}^{\prime}\right)=\emptyset$ and Proposition E．1－1 imply $Q_{1}^{\prime} \xrightarrow{\left(X_{1}^{\prime} \backslash A_{1}\right) \cup A_{2}} r Q_{1}^{\prime \prime}$ ．Similarly $Q_{2}^{\prime} \xrightarrow{\left(X_{2}^{\prime} \backslash A_{2}\right) \cup A_{1}} r Q_{2}^{\prime \prime}$ ．By induction hypothesis $Q_{1} \xrightarrow{X_{1}}{ }_{r} Q_{1}^{\prime} \xrightarrow{\left(X_{1}^{\prime} \backslash A_{1}\right) \cup A_{2}} r{ }_{r}^{\prime \prime}$ and $Q_{2} \xrightarrow{X_{2}}{ }_{r} Q_{2}^{\prime} \xrightarrow{\left(X_{2}^{\prime} \backslash A_{2}\right) \cup A_{1}} r Q_{2}^{\prime \prime}$ imply（i）$Q_{1}, Q_{1}^{\prime} \neq$ for any $\mu \in\left(X_{1}^{\prime} \backslash A_{1}\right) \cup A_{2} \cup\{\tau\}$ and（ii）$Q_{2}, Q_{2}^{\prime} \neq$ for any $\mu \in\left(X_{2}^{\prime} \backslash A_{2}\right) \cup A_{1} \cup\{\tau\}$ ．
Now we prove that $Q^{\prime} \neq$ 单（and similarly $Q$ ）for any $\mu \in X^{\prime} \cup\{\tau\}$ ．First $Q_{1}^{\prime} \nrightarrow$ and $Q_{2}^{\prime} \neq$ imply $Q^{\prime} \nRightarrow$ ．Let $\mu \in X^{\prime}$ and consider the following subcases：
－$\mu \in B$ ．Then $\mu \in X$ implies $\mu \in X_{1}^{\prime} \cup X_{2}^{\prime}$ and，hence，either $\mu \in X_{1}^{\prime}$ or $\mu \in X_{2}^{\prime}$ ． Assume $\mu \in X_{1}^{\prime}$（the case in which $\mu \in X_{2}$ can be proved similarly）．If $\mu \in A_{1}$ then， by（ii），$Q_{2}^{\prime} \neq$ 。 If $\mu \notin A_{1}$ and，hence，$\mu \in X_{1}^{\prime} \backslash A_{1}$ ，then，by（i），$Q_{1}^{\prime} \nRightarrow$ ．In both cases $Q^{\prime}$ 少。
－$\mu \notin B$ ．In this case $\mu \in X_{1}^{\prime}$ and $\mu \in X_{2}^{\prime}$ ．Moreover $\mu \notin A_{1}, A_{2} \subseteq B$ Thus $\mu \in X_{1}^{\prime} \backslash A_{1}$

Again by induction hypothesis we have $Q_{1}^{\prime}=Q_{1}^{\prime \prime}$ and $Q_{2}^{\prime}=Q_{2}^{\prime \prime}$ ．Then also $Q^{\prime}=Q^{\prime \prime}$ ．
2．Assume $Q$ guarded and，hence，both $Q_{1}$ and $Q_{2}$ guarded．Now，assume $Q \stackrel{\not y}{\nrightarrow}$ for any $\mu \in X \cup\{\tau\}$ ．By operational semantics we have that：（i）$Q_{1} \neq \nRightarrow$ and $Q_{2} \neq \neq$ ， for any $\mu \in(X \backslash B) \cup\{\tau\}$ and（ii）for any $\mu \in X \cap B$ either $Q_{1} \xrightarrow{\nRightarrow}$ or $Q_{2} \nRightarrow \nmid$ 。 Let $X_{i}^{\prime}=\left\{\mu \in X \cap B \mid Q_{i} \neq \mu\right\} \subseteq X \cap B \subseteq B$ and $X_{i}=(X \backslash B) \cup X_{i}^{\prime}$ ．Then，$Q_{i}$ guarded and $Q_{i} \neq \nrightarrow$ for any $\mu \in X_{i} \cup\{\tau\}$ implies，by induction hypothesis，$Q_{i} \xrightarrow{X_{i}} Q_{i}^{\prime}$ for $i=1,2$ ． Moreover，$B \cap\left(X_{1} \cup X_{2}\right)=B \cap\left((X \backslash B) \cup X_{1}^{\prime} \cup X_{2}^{\prime}\right)=X_{1}^{\prime} \cup X_{2}^{\prime},\left(X_{1} \cap X_{2}\right) \backslash B=$ $\left(X_{1} \backslash B\right) \cup\left(X_{2} \backslash B\right)=(X \backslash B) \cup(X \backslash B)=X \backslash B$ and，by（ii），$X \cap B=X_{1}^{\prime} \cup X_{2}^{\prime}$ ．
Finally $\left(B \cap\left(X_{1} \cup X_{2}\right)\right) \cup\left(\left(X_{1} \cap X_{2}\right) \backslash B\right)=(X \cap B) \cup(X \backslash B)=X$ and，by operational rules，$Q \xrightarrow{X}$ clean $\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)=Q^{\prime}$ ．Again by induction hypothesis we have that $Q_{1}^{\prime}{ }_{\neq}^{\not \longrightarrow}$ for any $\mu \in X_{1} \cup\{\tau\}$ and $Q_{2}^{\prime} \not \underset{\nrightarrow}{ }$ for any $\mu \in X_{2} \cup\{\tau\}$ ．Also in this case，$Q_{1}^{\prime} \neq$ and $Q_{2}^{\prime} \nrightarrow$ imply $Q^{\prime} \nRightarrow$ ．Now，let $\mu \in X$ ．If $\mu \in X \backslash B$ then $\mu \in X_{1}$ and $\mu \in X_{2}$ implies both $Q_{1}^{\prime} \nRightarrow$ and $Q_{2}^{\prime} \nRightarrow$ and，hence，$Q^{\prime} \underset{\leftrightarrows}{\mp}$ ．If $\mu \in X \cap B=X_{1}^{\prime} \cup X_{2}^{\prime}$ we have either $\mu \in X_{1}^{\prime} \subseteq X_{1}$ or $\mu \in X_{2}^{\prime} \subseteq X_{2}$ ．Thus，either $Q_{1}^{\prime} \stackrel{\mu}{\not}$ or $Q_{2}^{\prime} \neq \nRightarrow$ ．Also in this case $Q^{\prime} \nRightarrow$ 。

Rel: $Q=Q_{1}\left[\Phi_{u}\right]$. Let $X, X^{\prime} \subseteq \mathbb{A}, Y=\Phi^{-1}(X \cup\{\tau\}) \backslash\{\tau\}$ and $Y^{\prime}=\Phi^{-1}\left(X^{\prime} \cup\{\tau\}\right) \backslash\{\tau\}$. Then $\Phi(\tau)=\tau$ implies $\tau \in \Phi^{-1}(X \cup\{\tau\})$ and $\Phi^{-1}(X \cup\{\tau\})=\left(\Phi^{-1}(X \cup\{\tau\}) \backslash\{\tau\}\right) \cup\{\tau\}=Y \cup\{\tau\}$. Similarly, we have $\Phi^{-1}\left(X^{\prime} \cup\{\tau\}\right)=Y^{\prime} \cup\{\tau\}$.

1. By operational rules $Q \xrightarrow{X} r Q^{\prime} \xrightarrow{X^{\prime}} Q^{\prime \prime}$ implies $Q_{1} \xrightarrow{Y}_{r} Q_{1}^{\prime}{\xrightarrow{Y^{\prime}}}_{r} Q_{1}^{\prime \prime}, Q^{\prime}=Q_{1}^{\prime}\left[\Phi_{u}\right]$ and $Q^{\prime \prime}=Q_{1}^{\prime \prime}\left[\Phi_{u}\right]$. By induction hypothesis $Q_{1}, Q_{1}^{\prime} \xrightarrow{\mu^{\prime}}$ for any $\mu^{\prime} \in Y^{\prime} \cup\{\tau\}=\Phi^{-1}\left(X^{\prime} \cup\{\tau\}\right)$ and, hence, $Q, Q^{\prime} \neq$ for any $\mu \in X^{\prime} \cup\{\tau\}$. Again by induction hypothesis $Q_{1}^{\prime}=Q_{1}^{\prime \prime}$ and, hence, also $Q^{\prime}=Q^{\prime \prime}$.
 for any $\mu^{\prime} \in \Phi^{-1}(X \cup\{\tau\})=Y \cup\{\tau\}$. By induction hypothesis $Q_{1} \xrightarrow{Y}_{r} Q_{1}^{\prime}$ and, hence, $Q \xrightarrow{X}{ }_{r} Q_{1}^{\prime}[\Phi]=Q^{\prime}$. Again by induction hypothesis we have that $Q_{1}^{\prime} \stackrel{\mu^{\prime}}{\rightarrow}$ for any $\mu^{\prime} \in \Phi^{-1}(X \cup\{\tau\})$ and, by operational semantics, $Q^{\prime} \neq$ for any $\mu \in X \cup\{\tau\}$.

Rec: $Q=\operatorname{rec} x_{u} \cdot Q_{1}$

1. $Q \xrightarrow{X}{ }_{r}$ rec $x_{u} \cdot Q_{1}^{\prime}=Q^{\prime} \xrightarrow{X^{\prime}} r$ rec $x_{u} \cdot Q_{1}^{\prime \prime}=Q^{\prime \prime}$ implies $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime} \xrightarrow{X^{\prime}}{ }_{r} Q_{1}^{\prime \prime}$. By induction hypothesis, $Q_{1}, Q_{1}^{\prime} \nrightarrow$ for any $\mu \in X^{\prime} \cup\{\tau\}$. Thus, $x$ guarded in $Q_{1}$ and, hence, in $Q_{1}^{\prime}$ imply, by Proposition A.4-3, $Q_{1}\left\{\operatorname{rec} x_{u} \cdot\right.$ unmark $\left.\left(Q_{1}\right) / x\right\} \nmid \nrightarrow Q_{1}^{\prime}\left\{\operatorname{rec} x_{u}\right.$.unmark $\left.\left(Q_{1}^{\prime}\right) / x \mid\right\} \stackrel{\mu}{\nrightarrow}$ for any $\mu \in X^{\prime} \cup\{\tau\}$. Finally, by operational semantics, $Q, Q^{\prime} \neq$ for any $\mu \in X \cup\{\tau\}$. Again by induction hypothesis, we also have $Q_{1}^{\prime}=Q_{1}^{\prime \prime}$ and, clearly, $Q^{\prime}=Q^{\prime \prime}$.
2. Assume $Q$ and, hence, $Q_{1}$ action-guarded. In this case $Q \xrightarrow{\not \longrightarrow}$ for any $\mu \in X \cup\{\tau\}$ implies $Q_{1}\left\{\operatorname{rec} x_{u}\right.$.unmark $\left.\left(Q_{1}\right) / x\right\} \nmid \nrightarrow$ and, since $x$ is action-guarded in $Q_{1}$, also $Q_{1} \neq$ for any $\mu \in X \cup\{\tau\}$ (see Proposition A.4-3). Then, by induction hypothesis, $Q_{1} \xrightarrow{X}{ }_{r} Q_{1}^{\prime}$ and, by operational semantics, $Q \xrightarrow{X} r$ rec $x_{u} \cdot Q_{1}^{\prime}=Q^{\prime}$. Moreover, again by induction hypothesis, $Q_{1}^{\prime} \nRightarrow \nrightarrow$ for any $\mu \in X \cup\{\tau\}$. Then, since $x$ action-guarded in $Q_{1}$ implies $x$ action-guarded in $Q_{1}^{\prime}$, by Proposition A.4-3 we have that $Q_{1}^{\prime}\left\{\mid \operatorname{rec} x_{u}\right.$.unmark $\left.\left(Q_{1}^{\prime}\right) / x\right\} \neq$ for any $\mu \in X \cup\{\tau\}$. Finally, by operational rules, $Q^{\prime} \nRightarrow$ for any $\mu \in X \cup\{\tau\}$.

Proposition 5.12 Let $Q, Q^{\prime}, Q^{\prime \prime} \in \mathrm{L}(\tilde{\mathbb{P}})$.

1. $Q \xrightarrow{1} Q^{\prime} \xrightarrow{1} Q^{\prime \prime}$ implies $Q \xrightarrow{\nmid}$ and $Q^{\prime} \stackrel{\mu}{\nrightarrow}$ for any $\mu \in \mathbb{A}_{\tau}$. Moreover $Q^{\prime}=Q^{\prime \prime}$;
2. $Q$ guarded and $Q \xrightarrow{\nrightarrow}$ for any $\mu \in \mathbb{A}_{\tau}$ implies $Q \xrightarrow{1} Q^{\prime} \xrightarrow{1} Q^{\prime}$

## Proof:

1. If $Q \xrightarrow{1} Q^{\prime} \xrightarrow{1} Q^{\prime \prime}$ then, by Lemma F.2-1 and $Q, Q^{\prime} \not{\rightarrow}$ for any $\mu \in \mathbb{A}_{\tau}$ and $Q^{\prime}=Q^{\prime \prime}$.
2. By Lemma F.2-2, $Q$ guarded and $Q \not{\nrightarrow}$ for any $\mu \in \mathbb{A}_{\tau}$ implies that $Q \xrightarrow{1} Q^{\prime}$ and $Q^{\prime} \not{ }^{\mu}$ for any $\mu \in \mathbb{A}_{\tau}$. Moreover since $Q$ guarded implies also $Q^{\prime}$ guarded, again by Lemma F.2-2, there exists $Q^{\prime \prime}$ such that $Q^{\prime} \xrightarrow{1} Q^{\prime \prime}$. By Item $1, Q^{\prime}=Q^{\prime \prime}$ and the statement follows.

## G A Proof of Proposition 6.4

Proposition 6.4 Let $Q \in \mathrm{~L}(\tilde{\mathbb{P}})$ and $P \in \mathrm{~L}\left(\tilde{\mathbb{P}}_{1}\right)$ such that $P=\operatorname{unmark}(Q)$. Then:

1. $\mathrm{LE}(Q, A)=\mathrm{LE}(P, A)$ for every A ;
2. $Q \xrightarrow{\alpha} Q^{\prime}$ implies $P \xrightarrow{\alpha} P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$ for some $P^{\prime}$. Moreover $\operatorname{UE}\left(Q^{\prime}, A\right) \subseteq \operatorname{UE}(Q, A)$ and, whenever $Q^{\prime}$ is clean and $\operatorname{UE}\left(Q^{\prime}\right)=\emptyset$, we have $Q^{\prime}=P^{\prime}$;
3. $P \xrightarrow{\alpha} P^{\prime}$ implies $Q \xrightarrow{\alpha} Q^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$ for some $Q^{\prime}$.

Proof: Let us first consider Item 2. We prove this items indirectly by providing a proof of the following two statements:
$2.1 Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$ implies $P \stackrel{\alpha}{\rightsquigarrow} P^{\prime}$ for some $P^{\prime}$. Notice that if $Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$ and $P \stackrel{\alpha}{\sim} P^{\prime}$ then $Q=Q^{\prime}$ and $P^{\prime}=P$ trivially implies $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$. Moreover, $\operatorname{UE}\left(Q^{\prime}, A\right)=\operatorname{UE}(Q, A)$ and whenever $\operatorname{UE}\left(Q^{\prime}\right)=\emptyset$ and $Q^{\prime}$ is clean then-by Propositions 5.11-3. and 2.10-2.—we have $\mathcal{U}\left(Q^{\prime}\right)=\emptyset$, $Q^{\prime} \in \tilde{\mathbb{P}}_{1}$ and, finally, $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)=Q^{\prime}$.
$2.2 Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ implies $P \stackrel{\alpha}{\mapsto} P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$ for some $P^{\prime}$. Moreover $\operatorname{UE}\left(Q^{\prime}, A\right) \subseteq \operatorname{UE}(Q, A)$ and $\operatorname{UE}\left(Q^{\prime}\right)=\emptyset$ imples $Q^{\prime}=P^{\prime}$ (in this case the addition assumption that $Q^{\prime}$ is clean is not needed).

We prove statement 2.1 and Item 1 by induction on $Q$, while statement 2.2 will be proven by induction of length of derivation $Q \stackrel{\mu}{\mapsto} Q^{\prime}$. The proof for Item 3 is similar to the one for 2 and hence omitted. We proceed by case analysis on the structure of $Q$.

Nil, Var: $Q=\operatorname{nil}_{u}, Q=x_{u}$. In both cases $P=\operatorname{unmark}(Q)$ implies $P=Q$ and items 1. and 2. hold trivially.

Pref: $Q=\mu_{u} . P_{1}$ with $\mu \in\{\beta, \underline{\beta}\}$. In both case $P=\operatorname{unmark}(Q)$ implies $P=\beta_{u} \cdot P_{1}$. Then:

1. $\operatorname{LE}(P, A)=\operatorname{LE}(Q, A)=\{\langle u\rangle\}$ if $\beta \notin A, \operatorname{LE}(P, A)=\operatorname{LE}(Q, A)=\emptyset$ otherwise.
2.1 This case is not possible since $Q \underset{\sim}{\nsim}$.
$2.2 Q \stackrel{\alpha}{\mapsto} P_{1}$ implies $\alpha=\beta$ and hence $P \stackrel{\beta}{\mapsto} P_{1}$; since $P_{1} \in \mathrm{~L}\left(\tilde{\mathbb{P}}_{1}\right)$, it is also $P_{1}=\operatorname{unmark}\left(P_{1}\right)$. Moreover we have that $\operatorname{UE}\left(P_{1}, A\right)=\emptyset \subseteq \operatorname{UE}(Q, A), \operatorname{UE}\left(P_{1}\right)=\emptyset$ and, sure, $P_{1}=P_{1}$.

Read: $Q=\mu_{u 1} \triangleright_{u} Q_{1}$ with $\mu \in\{\beta, \underline{\beta}\}$. In both case $P=$ unmark $(Q)$ implies $P=\beta_{u 1} \triangleright_{u} P_{1}$ where $P_{1}=\operatorname{unmark}\left(Q_{1}\right)$. Then:

1. $\operatorname{LE}(P, A)=\{\langle u 1\rangle\} \cup \operatorname{LE}\left(P_{1}, A\right)=\{\langle u 1\rangle\} \cup \operatorname{LE}\left(Q_{1}, A\right)=\operatorname{LE}(Q, A)$ if $\beta \notin A$, $\operatorname{LE}(P, A)=\operatorname{LE}\left(P_{1}, A\right)=\operatorname{LE}\left(Q_{1}, A\right) \operatorname{LE}(Q, A)$ otherwise.
$2.1 Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$ if either $\alpha=\beta$ and $Q^{\prime}=Q$ or $Q_{1} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}$. In the former case $P \stackrel{\alpha}{\sim} P$ and the statement follows easily. In the latter one, by induction hypothesis, $P_{1} \xrightarrow{\sim} P_{1}^{\prime}$ with $P_{1}^{\prime}=$ $\operatorname{unmark}\left(Q_{1}^{\prime}\right)$. Thus, $P \stackrel{\alpha}{\rightsquigarrow} \beta_{u 1} \triangleright_{u} P_{1}^{\prime}=P^{\prime}$, with $P^{\prime}=\beta_{u 1} \triangleright_{u}$ unmark $\left(Q_{1}^{\prime}\right)=\operatorname{unmark}\left(Q^{\prime}\right)$.
$2.2 Q \stackrel{\alpha}{\mapsto} P_{1}$ implies $\alpha=\beta$ and hence $P \stackrel{\beta}{\mapsto} P_{1}$; since $P_{1} \in \mathrm{~L}\left(\tilde{\mathbb{P}}_{1}\right)$, it is also $P_{1}=\operatorname{unmark}\left(P_{1}\right)$. Moreover we have that $\operatorname{UE}\left(P_{1}, A\right)=\emptyset \subseteq \operatorname{UE}(Q, A), \operatorname{UE}\left(P_{1}\right)=\emptyset$ and, sure, $P_{1}=P_{1}$.

Sum: $Q=Q_{1}+{ }_{u} Q_{2}$. In this case, $P=\operatorname{unmark}(Q) \operatorname{implies} P_{i}=\operatorname{unmark}\left(Q_{i}\right)$, for $i=1,2$, and $P=P_{1}+{ }_{u} P_{2}$.

1. By induction hypothesis $\operatorname{LE}(P, A)=\mathrm{LE}\left(P_{1}, A\right) \cup \operatorname{LE}\left(P_{2}, A\right)=\operatorname{LE}\left(Q_{1}, A\right) \cup \operatorname{LE}\left(Q_{2}, A\right)=$ $\mathrm{LE}(Q, A)$, for every $A$.
2.1 By operational rules, $Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$ implies either (i) $Q_{1} \stackrel{\alpha}{\mapsto} Q_{1}^{\prime}$ and $Q^{\prime}=Q_{1}^{\prime}+Q_{2}$ or (ii) $Q_{2} \stackrel{\alpha}{\mapsto} Q_{2}^{\prime}$ and $Q^{\prime}=Q_{1}+Q_{2}^{\prime}$. We only prove the former case (the latter one is similar). By induction hypothesis, it is $P_{1} \stackrel{\alpha}{\mapsto} P_{1}^{\prime}$ with $P_{1}^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right)$. Thus, $P \stackrel{\alpha}{\mapsto} P_{1}^{\prime}+P_{2}=P^{\prime}$ with $P^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right)+\operatorname{unmark}\left(Q_{2}\right)=\operatorname{unmark}\left(Q_{1}^{\prime}+Q_{2}\right)=\operatorname{unmark}\left(Q^{\prime}\right)$.
2.2 By operational rules, $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ if either (i) $Q_{1} \stackrel{\alpha}{\mapsto} Q^{\prime}$ or (ii) $Q_{2} \stackrel{\alpha}{\mapsto} Q^{\prime}$. Consider the (i)-case (the other one is similar). By induction hypothesis, $Q_{1} \stackrel{\alpha}{\mapsto} Q^{\prime}$ implies $P_{1} \stackrel{\alpha}{\mapsto} P^{\prime}$ (i.e., again by operational rules $\left.P \xrightarrow{\alpha} P^{\prime}\right)$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$ for some $P^{\prime}$. Moreover, again by induction hypothesis, $\operatorname{UE}\left(Q^{\prime}, A\right) \subseteq \operatorname{UE}\left(Q_{1}, A\right) \subseteq \operatorname{UE}(Q, A)$ and $\operatorname{UE}\left(Q^{\prime}\right)=\emptyset$ implies $Q^{\prime}=P^{\prime}$.

Par: $Q=Q_{1} \|_{B}^{u} Q_{2}$. By definition unmark $(Q)=\operatorname{unmark}\left(Q_{1}\right) \|_{B}^{u} \operatorname{unmark}\left(Q_{2}\right)$. Thus $P=P_{1} \|_{B}^{u} P_{2}$, where $P_{i}=\operatorname{unmark}\left(Q_{i}\right)$ for every $i=1,2$. Then:

1. By induction hypothesis, $\operatorname{LE}\left(P_{i}, A \cup B\right) \cup \mathrm{LE}\left(Q_{i}, A \cup B\right)$ for $i=1,2$, and, for each $\alpha \in B \backslash A$, $\operatorname{LE}\left(P_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{LE}\left(P_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\operatorname{LE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \operatorname{LE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)$. By Definition 5.7 we can conclude that $\operatorname{LE}(P, A)=\operatorname{LE}(Q, A)$.
2.1 Assume $Q \stackrel{\alpha}{\rightsquigarrow} Q^{\prime}$ and consider the following three possible cases:
i. $\alpha \in B$ and $Q_{i} \stackrel{\alpha}{\rightsquigarrow} Q_{i}^{\prime}$ for $i=1,2$ and $Q^{\prime}=Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}$. By induction hypothesis $P_{i} \stackrel{\alpha}{\sim} P_{i}^{\prime}$ with $P_{i}^{\prime}=\operatorname{unmark}\left(Q_{i}^{\prime}\right)$, for every $i$. Then: $P \stackrel{\alpha}{\sim} P_{1}^{\prime} \|_{B}^{u} P_{2}^{\prime}=P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$.
ii. $\alpha \notin B$ and $Q_{1} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}$ and $Q^{\prime}=Q_{1}^{\prime} \|_{B}^{u} Q_{2}$. By induction hypothesis $P_{1} \stackrel{\alpha}{\rightsquigarrow} P_{1}^{\prime}$ with $P_{1}^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right)$. Then: $P \stackrel{\alpha}{\sim} P_{1}^{\prime} \|_{B}^{u} P_{2}=P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$
iii. $\alpha \notin B$ and $Q_{2} \underset{\rightsquigarrow}{\alpha} Q_{2}^{\prime}$ and $Q^{\prime}=Q_{1} \|_{B}^{u} Q_{2}^{\prime}$. Similar to the previous one.
2.2 Assume $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ and consider the following three possible cases:
i. $\alpha \in B$ and $Q_{i} \stackrel{\alpha}{\mapsto} Q_{i}^{\prime}$ for $i=1,2$ and $Q^{\prime}=$ clean $\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)$. By induction hypothesis $P_{i} \stackrel{\alpha}{\mapsto} P_{i}^{\prime}$ with $P_{i}^{\prime}=\operatorname{unmark}\left(Q_{i}^{\prime}\right), \mathrm{UE}\left(Q_{i}^{\prime}, A\right) \subseteq \mathrm{UE}\left(Q_{i}, A\right)$ and $\operatorname{UE}\left(Q_{i}^{\prime}\right)=\emptyset$ implies $Q_{i}^{\prime}=P_{i}^{\prime}$, for every $i$ and $A$. Then: $P \stackrel{\alpha}{\mapsto}$ clean $\left(P_{1}^{\prime} \|_{B}^{u} P_{2}^{\prime}\right)=P_{1}^{\prime} \|_{B}^{u} P_{2}^{\prime}=P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$. Moreover, by Lemma A.11, it is $\operatorname{UE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}, A\right)=$ $\mathrm{UE}\left(Q_{1}^{\prime}, A \cup B\right) \cup \mathrm{UE}\left(Q_{2}^{\prime}, A \cup B\right) \cup \bigcup_{\alpha \in B \backslash A}\left(\mathrm{UE}\left(Q_{1}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \mathrm{UE}\left(Q_{2}^{\prime}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \subseteq\right.$ $\mathrm{UE}\left(Q_{1}, A \cup B\right) \cup \mathrm{UE}\left(Q_{2}, A \cup B\right) \cup \bigcup_{\alpha \in B \backslash A}\left(\mathrm{UE}\left(Q_{1}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right) \times \mathrm{UE}\left(Q_{2}, \mathbb{A}_{\tau} \backslash\{\alpha\}\right)=\right.$ $\mathrm{UE}(Q, A)$.
Now assume $\operatorname{UE}\left(Q^{\prime}\right)=\operatorname{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}, A\right)=\emptyset$. By Propositions 5.11-3 and A.5-3, we also have $\mathcal{U}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)=\emptyset$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)=\operatorname{unmark}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}^{\prime}\right)=$ $P_{1}^{\prime} \|_{B}^{u} P_{2}^{\prime}=P^{\prime}$.
ii. $\alpha \notin B$ and $Q_{1} \stackrel{\alpha}{\mapsto} Q_{1}^{\prime}$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right)$. By induction hypothesis $P_{1} \stackrel{\alpha}{\mapsto} P_{1}^{\prime}$ with $P_{1}^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right), \mathrm{UE}\left(Q_{1}^{\prime}, A\right) \subseteq \mathrm{UE}\left(Q_{1}, A\right)$ for every $A$ and $\mathrm{UE}\left(Q_{1}^{\prime}\right)=\emptyset$ implies $Q_{1}^{\prime}=P_{1}^{\prime}$. Then: $P \stackrel{\alpha}{\mapsto}$ clean $\left(P_{1}^{\prime} \|_{B}^{u} P_{2}\right)=P_{1}^{\prime} \|_{B}^{u} P_{2}=P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right)$. Again by Lemma A.11, it is $\operatorname{UE}\left(Q^{\prime}, A\right)=\operatorname{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}, A\right)$ and as in the previous case we can prove that $\mathrm{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}, A\right) \subseteq \mathrm{UE}(Q, A)$.
Now assume $\operatorname{UE}\left(Q^{\prime}\right)=\operatorname{UE}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}, A\right)=\emptyset$. By Propositions 5.11-3 and A.5-3, we also have $\mathcal{U}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right)=\emptyset$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right)=\operatorname{unmark}\left(Q_{1}^{\prime} \|_{B}^{u} Q_{2}\right)=$ $P_{1}^{\prime} \|_{B}^{u} P_{2}=P^{\prime}$.
iii. $\alpha \notin B$ and $Q_{2} \stackrel{\alpha}{\mapsto} Q_{2}^{\prime}$ and $Q^{\prime}=\operatorname{clean}\left(Q_{1} \|_{B}^{u} Q_{2}^{\prime}\right)$. Similar to the previous one.

Rel: $Q=Q_{1}\left[\Phi_{u}\right]$. In this case $P=\operatorname{unmark}(Q) \operatorname{implies} P=P_{1}\left[\Phi_{u}\right]$ with $P_{1}=\operatorname{unmark}\left(Q_{1}\right)$. Then:

1. By induction hypothesis $\operatorname{LE}(P, A)=\operatorname{LE}\left(P_{1}, \Phi^{-1}(A)\right)=\operatorname{LE}\left(Q_{1}, \Phi^{-1}(A)\right)=\operatorname{LE}(Q, A)$.
2.1 By operational rules, $Q \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}\left[\Phi_{u}\right]=Q^{\prime}$ if there exists $\beta \in \Phi^{-1}(\alpha)$ such that $Q_{1} \stackrel{\beta}{\rightsquigarrow} Q_{1}^{\prime}$. By induction hypothesis $P_{1} \stackrel{\beta}{\rightsquigarrow} P_{1}^{\prime}$ and $P_{1}^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right)$ which implies $P \stackrel{\alpha}{\rightsquigarrow} P_{1}^{\prime}\left[\Phi_{u}\right]=P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right)\left[\Phi_{u}\right]=\operatorname{unmark}\left(Q^{\prime}\right)$.
2.2 By operational rules, $Q \stackrel{\alpha}{\mapsto} Q_{1}^{\prime}\left[\Phi_{u}\right]=Q^{\prime}$ if there exists $\beta \in \Phi^{-1}(\alpha)$ such that $Q_{1} \stackrel{\beta}{\mapsto} Q_{1}^{\prime}$. By induction hypothesis $P_{1} \stackrel{\beta}{\mapsto} P_{1}^{\prime}$ and $P_{1}^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right)$ which implies $P \stackrel{\alpha}{\mapsto} P_{1}^{\prime}\left[\Phi_{u}\right]=P^{\prime}$ and $P^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right)\left[\Phi_{u}\right]=\operatorname{unmark}\left(Q^{\prime}\right)$. Again by induction hypothesis $\operatorname{UE}\left(Q^{\prime}, A\right)=$ $\operatorname{UE}\left(Q_{1}^{\prime}, \Phi^{-1}(A)\right) \subseteq \operatorname{UE}\left(Q_{1}, \Phi^{-1}(A)\right)=\operatorname{UE}(Q, A)$ and $\operatorname{UE}\left(Q^{\prime}\right)=\operatorname{UE}\left(Q_{1}^{\prime}\right)=\emptyset$ implies $Q_{1}^{\prime}=P_{1}^{\prime}$ and, hence, $Q^{\prime}=P^{\prime}$.

Rec: $Q=\operatorname{rec} x_{u} \cdot Q_{1}$. In this case $P=\operatorname{unmark}(Q)$ implies $P=\operatorname{rec} x_{u} \cdot P_{1}$ with $P_{1}=\operatorname{unmark}\left(Q_{1}\right)$.

1. By induction hypothesis, $\operatorname{LE}(P, A)=\operatorname{LE}\left(P_{1}, A\right)=\operatorname{LE}\left(Q_{1}, A\right)=\operatorname{LE}(Q, A)$.
$2.1 Q \stackrel{\alpha}{\rightsquigarrow}$ rec $x . Q_{1}^{\prime}=Q^{\prime}$ if $Q_{1} \stackrel{\alpha}{\rightsquigarrow} Q_{1}^{\prime}$. By induction hypothesis we have that $P_{1} \stackrel{\alpha}{\rightsquigarrow} P_{1}^{\prime}$ and $P_{1}^{\prime}=\operatorname{unmark}\left(Q_{1}^{\prime}\right)$. Thus, $P \stackrel{\alpha}{\sim}$ rec $x . P_{1}^{\prime}=P^{\prime}$ and $P^{\prime}=\operatorname{rec} x . \operatorname{unmark}\left(Q_{1}^{\prime}\right)=\operatorname{unmark}\left(Q^{\prime}\right)$.
2.2 Let $R=Q_{1}\left\{\mid \operatorname{rec} x_{u}\right.$. unmark $\left.\left(Q_{1}\right) / x \mid\right\}=Q_{1}\left\{\left|\operatorname{rec} x_{u} \cdot P_{1} / x\right|\right\}$ and $S=$ unmark $(R)$. $x$ actionguarded in $Q_{1}$ and Propositions A.4-2 imply $\operatorname{UE}(R, A)=\operatorname{UE}\left(Q_{1}, A\right)=\operatorname{UE}(Q, A)$; moreover, by Proposition A.7-2, $x$-action-guarded in $Q_{1}$ also implies $S=\operatorname{unmark}(R)=$ $\operatorname{unmark}\left(Q_{1}\right)\left\{\left|\operatorname{rec} x_{u} . P_{1} / x\right|\right\}=P_{1}\left\{\left|\operatorname{rec} x_{u} . P_{1} / x\right|\right\}$.
Now assume $Q \stackrel{\alpha}{\mapsto} Q^{\prime}$ and hence, by operational rules, that $R \stackrel{\alpha}{\mapsto} Q^{\prime}$. By induction hypothesis $S=\operatorname{unmark}(R) \stackrel{\alpha}{\mapsto} P^{\prime}$ - by operational rule this also implies $P \stackrel{\alpha}{\mapsto} P^{\prime}$-for some $P^{\prime}$ with $P^{\prime}=\operatorname{unmark}\left(Q^{\prime}\right), \operatorname{UE}\left(Q^{\prime}, A\right) \subseteq \mathcal{U}(R, A)=\operatorname{UE}(Q, A)$ for every $A$ and $\mathrm{UE}\left(Q^{\prime}\right)=\emptyset$ implies $Q^{\prime}=P^{\prime}$.

## H Proof of Theorem 8.2

We start with two lemmas:
Lemma H. 1 Let $P, P^{\prime}, P^{\prime \prime} \in \tilde{\mathbb{P}}_{1}, Q^{\prime} \in \tilde{\mathbb{P}}, v, w \in \mathbb{A}_{\tau}$ such that $P \xrightarrow{v} P^{\prime} \xrightarrow{1} Q^{\prime} \xrightarrow{w} P^{\prime \prime}$. Then there exists $Q \in \tilde{\mathbb{P}}$ such that $P \xrightarrow{1} Q \xrightarrow{v w} P^{\prime \prime}$.

Proof: Let $S \in \mathrm{~L}(P)$. By repeated applications of Proposition A.3-(ii), if $P \xrightarrow{v} P^{\prime}$ (in the unlabelled $\mathrm{PAFAS}_{r}$ ) then $S \xrightarrow{v} S^{\prime}$ for some $S^{\prime}$ with $P^{\prime}=\mathrm{R}\left(S^{\prime}\right)$ (and hence for some $S^{\prime} \in \mathrm{L}\left(P^{\prime}\right)$ ).

Again due to repeated applications of Proposition A.3-(ii), if $P^{\prime} \xrightarrow{1} Q^{\prime} \xrightarrow{w} P^{\prime \prime}$ then there exists $R^{\prime} \in \mathrm{L}\left(Q^{\prime}\right)$ and $S^{\prime \prime} \in \mathrm{L}\left(P^{\prime \prime}\right) \subseteq \mathrm{LAB}\left(\tilde{\mathbb{P}}_{1}\right)$ such that $S^{\prime} \xrightarrow{1} R^{\prime} \xrightarrow{w} S^{\prime \prime}$. Moreover, since $S^{\prime \prime} \in \mathrm{LAB}\left(\tilde{\mathbb{P}}_{1}\right)$ implies $S^{\prime \prime} \xrightarrow{1}$, by Proposition B.5-2, we can conclude that $S^{\prime} \xrightarrow{w} \operatorname{LE}\left(S^{\prime}\right) S^{\prime \prime}$.

Now, $S \xrightarrow{v} S^{\prime}$ and $S^{\prime} \xrightarrow{w} \operatorname{LE}\left(S^{\prime}\right) S^{\prime \prime}$ imply $S \xrightarrow{v w} \operatorname{LE}(S) S^{\prime \prime}$ (this is a trivial consequence of the
 A.3-(i) implies that $P \xrightarrow{1} Q \xrightarrow{v w} \operatorname{LE}(S) P^{\prime \prime}$ where $P=\mathrm{R}(S), Q=\mathrm{R}(R)$ and $P^{\prime \prime}=\mathrm{R}\left(S^{\prime \prime}\right)$

The next lemma is a trivial consequence of the previous one.
Lemma H. 2 Let $S, S^{\prime}, S^{\prime \prime} \in \tilde{\mathbb{S}}_{1}, Q^{\prime} \in \tilde{\mathbb{S}}$ with $S$ read-proper, $v, w \in \mathbb{A}_{\tau}$ such that $S \xrightarrow{v} S^{\prime} \xrightarrow{1} Q^{\prime} \xrightarrow{w}$ $S^{\prime \prime}$. Then there exists $Q \in \tilde{\mathbb{S}}$ such that $S \xrightarrow{1} Q \xrightarrow{v w} S^{\prime \prime}$.

Proof: Assume that $S \xrightarrow{v} S^{\prime} \xrightarrow{1} Q^{\prime} \xrightarrow{w} S^{\prime \prime}$. Then, by Theorem 4.3-1, we also have $\llbracket S \rrbracket \xrightarrow{v} \llbracket S^{\prime} \rrbracket \xrightarrow{1}$ $\llbracket Q^{\prime} \rrbracket \xrightarrow{w} \llbracket S^{\prime \prime} \rrbracket$. Now, by Lemma H.1, there is $Q^{\prime \prime} \in \tilde{\mathbb{P}}$ such that $\llbracket S^{1} \xrightarrow{1} Q^{\prime \prime} \xrightarrow{v w} \llbracket S^{\prime \prime} \rrbracket$. By Theorem 4.3-2, we have finally that there is $Q \in \tilde{\mathbb{S}}$ with $\llbracket Q \rrbracket=Q^{\prime \prime}$ such that $S \xrightarrow{1} Q \xrightarrow{v w} S^{\prime \prime}$.

Now we can prove Theorem 8.2:
Theorem 8.2 Dekker is live iff Dekker $_{i o}$ does not have catastrophic cycles.
Proof: Assume to the contrary that Dekker $\in \mathbb{S}_{1}$ and, hence, $\llbracket$ Dekker $\rrbracket \in \mathbb{P}_{1}$ are not live. According to Theorems 6.8 and 6.9 , there is a timed execution sequence with infinitely many steps along which a process (by symmetry, we can assume it is $\mathrm{P}_{2}$ ) requests to enter its critical section (it performs $\mathrm{req}_{2}$ ), but $P_{2}$ never performs $\mathrm{cs}_{2}$ afterwards. In the following, we will prove that this timed execution corresponds to a catastrophic cycle in the rRTS of $\llbracket D^{2} k k e r_{i o} \rrbracket$. Since - by Theorem 4.3 - we have $\operatorname{RTS}\left(\right.$ Dekker $\left._{i o}\right)=\operatorname{RTS}\left(\llbracket\right.$ Dekker $\left._{i o} \rrbracket\right)$ as well as $\mathrm{rRTS}\left(\right.$ Dekker $\left._{i o}\right)=\mathrm{rRTS}\left(\llbracket\right.$ Dekker $\left._{i o} \rrbracket\right)$, the above result allows us to conclude the proof.

Let $\gamma=\llbracket$ Dekker $\rrbracket \xrightarrow{1} Q \xrightarrow{w_{0}} R_{0} \xrightarrow{1} Q_{0} \xrightarrow{w_{1}} R_{1} \xrightarrow{1} Q_{1} \xrightarrow{w_{2}} R_{2} \xrightarrow{1} \ldots$ be a computation as above; we call it a witness. Assume that the last $\mathrm{req}_{2}$ is an action of $w_{i}$ (for some $i \geq 0$ ) and, hence, that the action $\mathrm{cs}_{2}$ never occurs in $w_{j}$, for any $j>i$.

Let $w=w_{0} w_{1} \ldots w_{i}$. Since $P \xrightarrow{1} Q$ implies $P=\operatorname{unmark}(Q)$ for a generic $P \in \tilde{\mathbb{P}}_{1}$, repeated application of Proposition 6.4-2 (at first to $\llbracket D e k k e r \rrbracket$ and $Q$ ) shows that $\llbracket D e k k e r \rrbracket$ can perform $w$ and that the process reached is unmark $\left(R_{i}\right)=R_{i}$ (this follows since $R_{i} \in \widetilde{\mathbb{P}}_{1}$ by Propositions 2.10 and 5.11); thus $\gamma^{\prime}=\llbracket$ Dekker $\rrbracket \xrightarrow{w} R_{i} \xrightarrow{1} Q_{i} \xrightarrow{w_{i+1}} R_{i+1} \xrightarrow{1} Q_{i+1} \xrightarrow{w_{i+2}} R_{i+2} \xrightarrow{1} \ldots$ is also a timed execution sequence where $\mathrm{cs}_{2}$ is pending indefinitely.

Now, assume that one or more occurrences of the $\tau$ in conflict with $\mathrm{req}_{2}$ are performed before the last $\mathrm{req}_{2}$. Since all processes in this part of $\gamma^{\prime}$ are initial, such $\tau$ 's do not change the process; moreover, after the last req ${ }_{2}$, there are no such $\tau$ 's anyway. Thus, we can remove all such internal steps and obtain a timed execution sequence $\gamma^{\prime \prime}=\llbracket$ Dekker $\rrbracket \xrightarrow{w^{\prime}} R_{i} \xrightarrow{1} Q_{i} \xrightarrow{w_{i+1}} R_{i+1} \xrightarrow{1} Q_{i+1} \xrightarrow{w_{i+2}}$ $R_{i+2} \xrightarrow{1} \ldots$ where again $\mathrm{cs}_{2}$ is pending indefinitely ( $w^{\prime}$ is $w$ where the $\tau$ 's in conflict with req ${ }_{2}$ have been removed).

Starting from $R_{i}$, it may either happen that both processes $\mathrm{P}_{1}$ and $\mathrm{P}_{2}$ get stuck or only process $P_{2}$ gets stuck while $P_{1}$ repeatedly enters and exits its critical section. In both cases, there is a set of states that are repeatedly entered along the computation $\gamma^{\prime \prime}$. Without loss of generality, we may assume that there exists $j, k$ with $i \leq j \leq k$ such that $R_{j}=R_{k+1}$. Hence, $\gamma^{\prime \prime}=\llbracket$ Dekker $\xrightarrow{w^{\prime}} R_{i} \xrightarrow{1}$ $Q_{i} \xrightarrow{w_{i+1}} R_{i+1} \xrightarrow{1} \ldots \xrightarrow{w_{j}} R_{j} \xrightarrow{1} Q_{j} \xrightarrow{w_{j+1}} R_{j+1} \xrightarrow{1} \ldots \xrightarrow{w_{k}} R_{k} \xrightarrow{1} Q_{k} \xrightarrow{w_{k+1}} R_{j} \xrightarrow{1} \ldots$

Now, we change all req ${ }_{1}$ and $\mathrm{cs}_{1}$ occurring in $\gamma^{\prime \prime}$ into $\tau$; we also change all $\mathrm{req}_{2}$ and $\mathrm{cs}_{2}$ into in and out, respectively. This gives a timed execution sequence of $\llbracket D^{2} k k e r_{i o} \rrbracket$ since the hidden and renamed actions are not synchronised or relabelled. In our case, we obtain a computation of the form $\llbracket$ Dekker $_{i} \rrbracket \xrightarrow{v^{\prime \prime}} R_{i}^{\prime} \xrightarrow{1} Q_{i}^{\prime} \xrightarrow{v_{i+1}} R_{i+1}^{\prime} \xrightarrow{1} \ldots \xrightarrow{v_{j}} R_{j}^{\prime} \xrightarrow{1} Q_{j}^{\prime} \xrightarrow{v_{j+1}} R_{j+1}^{\prime} \xrightarrow{1} \ldots \xrightarrow{v_{k}} R_{k}^{\prime} \xrightarrow{1} Q_{k}^{\prime} \xrightarrow{v_{k+1}}$ $R_{j}^{\prime} \xrightarrow{1} \ldots$ with $v_{i+1}, \ldots, v_{j}, v_{j+1}, \ldots, v_{k}, v_{k+1} \in\{\tau\}^{*}$ (recall that $\mathrm{cs}_{2}$ (out) and, hence, also req $_{2}$ (in) never occur in $w_{j}\left(v_{j}\right.$, resp.) for each $\left.j \geq i\right)$. This computation demonstrates that $\llbracket D^{2} k k e r_{i} \rrbracket$ has a catastrophic cycle.

Now, we prove the reverse implication. If a process reachable from Dekker $_{i o}$ has a pending out (corresponding to $\mathrm{Cs}_{2}$ ), then it cannot perform in (corresponding to $\mathrm{req}_{2}$ ) as we can read off from the structure of $P_{2}$; thus, if such a process can refuse out, it can also refuse $\{$ in, out $\}$. Thus, in the reduced refusal transition system of $D^{2 k k e r} r_{i o}$, all time steps are full. Hence, if there exists a catastrophic cycle, this can be translated back to a computation of Dekker with infinitely many time steps (all full) where either (i) $\mathrm{P}_{2}$ is stuck after performing $\mathrm{cs}_{2}$ in $\left\{k w 1 . b_{2} w f . P_{2}, \underline{k w 1} . b_{2} w f . P_{2}\right\}$ or in $\left\{b_{2} w f . P_{2}, b_{2} w f . P_{2}\right\}$ or (ii) there is a req $q_{2}$ not followed by $\mathrm{cs}_{2}$. In case (ii), we obtain a computation that is almost a witness ("almost" because it might not start with a time step); but with Lemma H.2, we can transform the start $S \xrightarrow{v} S^{\prime} \xrightarrow{1} Q^{\prime} \xrightarrow{w} S^{\prime \prime}$ to $S \xrightarrow{1} Q \xrightarrow{v w} S^{\prime \prime}$ and are done.

We now prove that case (i) is not possible. First, assume that $\mathrm{P}_{2}$ is stuck in $\left\{b_{2} w f . P_{2}, b_{2} w f . P_{2}\right\}$, and consider a state where $P_{2}$ enters $\left\{b_{2} w f . P_{2}, b_{2} w f . P_{2}\right\}$ for the last time. After the next time step, it is in state $b_{2} w f . P_{2}$, i.e. Dekker $i_{i o}$ is in a state $\left(\left(\overline{Q_{1} \|} b_{2} w f . P_{2}\right) \|_{B}\left(\mathrm{~B}_{1}^{\prime}(x) \| \mathrm{B}_{2}^{\prime}(\right.\right.$ true $\left.\left.) \| \mathrm{K}^{\prime}(y)\right)\right)\left[\Phi^{\prime}\right]$ where $\Phi^{\prime}$ is the suitable (hiding and ) renaming and $Q_{1}, \overline{\mathrm{~B}_{1}^{\prime}(x)}, \mathrm{B}_{2}^{\prime}($ true $)$ and $\mathrm{K}^{\prime}(1)$ are the states of the other component processes. In particular, we have either $\mathrm{B}_{2}^{\prime}($ true $)=\left\{\underline{b_{2} r t}, b_{2} w t\right\} \triangleright b_{2} w f . \mathrm{B}_{2}($ false $)$ or $\mathrm{B}_{2}^{\prime}($ true $)=\left\{b_{2} r t, b_{2} w t\right\} \triangleright \underline{b_{2} w f} . \mathrm{B}_{2}$ (false) (depending on the enabledness and hence urgency of $b_{2} r t$ in $\left.Q_{1}\right)$. Now, since the process $\mathrm{P}_{1}$ can read but not write the variable $b_{2}$, the internal action corresponding to the writing of the value false on $b_{2}$ is always enabled and urgent in all the states we can reach from $Q$ via a sequence of internal actions due to moves of $\mathrm{P}_{1}$; thus, no further time step is possible, a contradiction.

Second, we assume that $\mathrm{P}_{2}$ is stuck in $\left\{k w 1 . b_{2} w f . P_{2}, \underline{k w 1} . b_{2} w f . P_{2}\right\}$; analogously, there is a state $Q=\left(\left(Q_{1} \| k w 1 . b_{2} w f . P_{2}\right) \|_{B}\left(\left(\mathrm{~B}_{1}^{\prime}(x) \| \mathrm{B}_{2}^{\prime}(\right.\right.\right.$ true $\left.\left.) \| \mathrm{K}^{\prime}(y)\right)\right)\left[\Phi^{\prime}\right]$ on the computation such that $\mathrm{P}_{2}$ never performs an action again. We distinguish two further subcases:
$y=2$ We reach a state like $Q$ where $y=2$. Then, either $\mathrm{K}^{\prime}(y)=\{k r 2, k w 2\} \triangleright \underline{k w 1} . \mathrm{K}(1)$ or $\mathrm{K}^{\prime}(y)=\{\underline{k r 2}, k w 2\} \triangleright \underline{k w 1} . \mathrm{K}(1)$ or $\mathrm{K}^{\prime}(y)=\{k r 2, \underline{k w 2}\} \triangleright \underline{k w 1} \cdot \mathrm{~K}(1)$. This case is similar to the previous one, since the process $\mathrm{P}_{1}$ never writes value 1 into the variable $k$; thus, $k w 1$ remains urgent, and we again derive a contradiction.
$y=1$ We do not reach a suitable state with $y=2$. Then, either $\mathrm{K}^{\prime}(y)=\{\underline{k r} 1, \underline{k w} 1\} \triangleright k w 2 . \mathrm{K}(2)$ (if the action $k r 1$ is enabled in $Q_{1}$ ) or $\mathrm{K}^{\prime}\left((1)=\{k r 1, \underline{k w 1}\} \triangleright k w 2 . \mathrm{K}(2)\right.$; it is not possible that $Q_{1}$ enables $k w 2$, since then $Q_{1} \in\left\{k w 2 . b_{1} w f . P_{1}, \underline{k w 2} . b_{1} w f . P_{1}\right\}$ and we would get to a state like $Q$ with $y=2$ before the next time step. Thus, again $k w 1$ remains urgent, giving a contradiction.

[^0]:    ${ }^{1}$ PAFAS is not time domain dependent, meaning that the choice of discrete or continuous time makes no difference for the testing-based semantics of asynchronous systems, see [8] for more details.

[^1]:    ${ }^{2}$ To be formally precise: we have to replace all arrows $\mapsto$, in Table 1 by $\rightarrow$.

[^2]:    ${ }^{3}$ Since Costa and Stirling deal with fairness of components, they have no need for tuples.
